## **EXPERIMENT – 1**

### **What is a computer?**

A computer is an electronic device that manipulates information, or data. It has the ability to store, retrieve, and process data.

### **History of computers**

In the early 1820s, it was designed by Charles Babbage who is known as "Father of Modern Computer". It was a mechanical computer which could perform simple calculations. It was a steam driven calculating machine designed to solve tables of numbers like logarithm tables. Modern computers can perform generic sets of operations known as programs. These programs enable computers to perform a wide range of tasks. A computer system is a "complete" computer that includes the hardware, operating system (main software), and peripheral equipment needed and used for "full" operation. This term may also refer to a group of computers that are linked and function together, such as a computer network or computer cluster.

A broad range of industrial and consumer products use computers as control systems. Simple special-purpose devices like microwave ovens and remote controls are included, as are factory devices like industrial robots and computer-aided design, as well as general-purpose devices like personal computers and mobile devices like smartphones. Computers power the Internet, which links billions of other computers and users.

Early computers were meant to be used only for calculations. Simple manual instruments like the abacus have aided people in doing calculations since ancient times. Early in the Industrial Revolution, some mechanical devices were built to automate long tedious tasks, such as guiding patterns for looms. More sophisticated electrical machines did specialized analog calculations in the early 20th century. The first digital electronic calculating machines were developed during World War II. The first semiconductor transistors in the late 1940s were followed by the silicon-based MOSFET (MOS transistor) and monolithic integrated circuit (IC) chip technologies in the late 1950s, leading to the microprocessor and the microcomputer revolution in the 1970s. The speed, power and versatility of computers have been increasing dramatically ever since then, with transistor counts increasing at a rapid pace (as predicted by Moore's law), leading to the Digital Revolution during the late 20th to early 21st centuries.

## **Components of Computer**

### **1. Mother Board**

A motherboard (also called mainboard, main circuit board, mb, mboard, backplane board, base board, system board, logic board (only in Apple PCs) or mobo) is the main printed circuit board (PCB) in general-purpose computers and other expandable systems. It holds and allows communication between many of the crucial electronic components of a system, such as the central processing unit (CPU) and memory, and provides connectors for other peripherals. Unlike a backplane, a motherboard usually contains significant sub-systems, such as the central processor, the chipset's input/output and memory controllers, interface connectors, and other components integrated for general use.

The motherboard is mounted inside the case and is securely attached via small screws through pre-drilled holes. Motherboard contains ports to connect all of the internal components. It provides a single socket for CPU, whereas for memory, normally one or more slots are available. Motherboards provide ports to attach the floppy drive, hard drive, and optical drives via ribbon cables. Motherboard carries fans and a special port designed for power supply.

There is a peripheral card slot in front of the motherboard using which video cards, sound cards, and other expansion cards can be connected to the motherboard.

On the left side, motherboards carry a number of ports to connect the monitor, printer, mouse, keyboard, speaker, and network cables. Motherboards also provide USB ports, which allow compatible devices to be connected in plug-in/plug-out fashion. For example, pen drive, digital cameras, etc.

## **2. Ram Modules**

In computing, a memory module or RAM (random-access memory) stick is a printed circuit board on which memory integrated circuits are mounted. Memory modules permit easy installation and replacement in electronic systems, especially computers such as personal computers, workstations, and servers. The first memory modules were proprietary designs that were specific to a model of computer from a specific manufacturer.

### **3. Daughter cards**

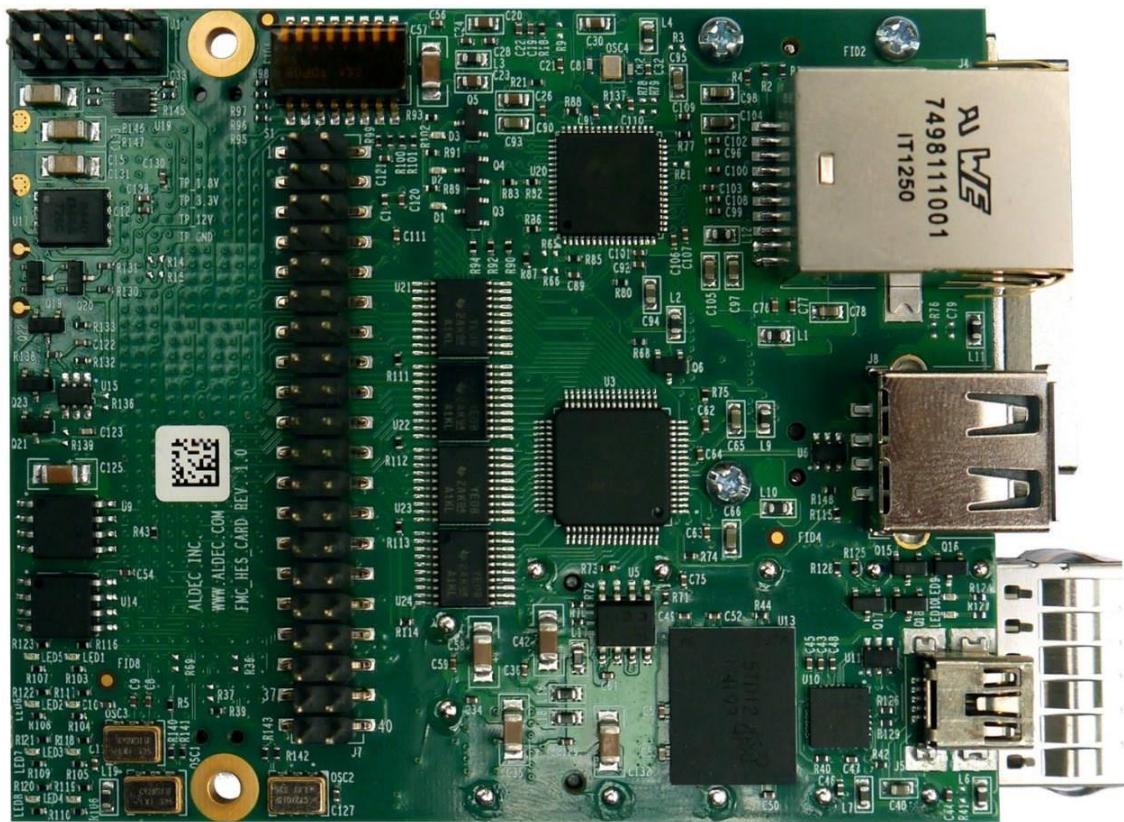

A daughterboard is type of circuit board that plugs in or is attached to the motherboard or similar expansion card to extend its features and services. A daughterboard complements the existing functionality of a motherboard or an expansion card. A daughterboard is also known as daughter card, piggyback board, riser card or mezzanine board. A daughterboard is connected directly to the motherboard. Unlike expansion cards, which connect with the motherboard using bus and other serial interfaces, daughterboards are usually directly embedded through soldering. Like a motherboard, a daughterboard has sockets, pins, plugs and connectors to be attached to other boards. Typically, daughterboards are released as a post-launch update to a motherboard or expansion card. For example, a MIDI daughterboard is used to add on the functionality of the sound card.

#### **Functionalities of daughter board:**

- It is known as the piggyback board, riser card, daughtercard etcetera.
- A daughter board is smaller than a motherboard and may have some slots like the motherboard.
- A daughter board is a printed circuit board which is connected to the motherboard or expansion card.
- Unlike expansion card, daughter boards are directly connected to the motherboard by soldering.
- Daughter boards do not provide new functions to the circuit like an expansion but they extend the circuitry of the circuit in which they are plugged into.
  
- Daughter boards are released by the vendors as an update of motherboard or expansion card.

#### **List of daughter cards**

- Video Card: This is also referred to as the graphics adapter, display adapter or video adapter.
- Sound Card: To handle sound, to insert a microphone or connect a speaker this sound card is used.
- Network Interface Card: This is also referred as NIC. The computer can be connected to a network only with the use of this network interface card.
- Ethernet Card: Ethernet card is used to connect computers to computers. A cable is used to connect the Ethernet cards in each computer to make a network.

#### **4. Bus slots**

An expansion slot refers to any of the slots on a motherboard that can hold an expansion card to expand the computer's functionality, like a video card, network card, or sound card. The expansion card is plugged directly into the expansion port so that the motherboard has direct access to the hardware. However, since all computers have a limited number of expansion slots, it's important to open your computer and check what's available before you buy one. Some older systems require the use of a riser board to add additional expansion cards; however, modern computers not only usually have enough expansion slot options, but they also have features integrated directly into the motherboard, eliminating the need for so many expansion cards. There are three different types of expansion slots: PCI Express, PCI, and AGP.

**PCI (Peripheral Component Interconnect) Slot:** The PCI slot is the most common form of internal expansion for a PC. Some PCs have a mixture of PCI and PCI Express slots.

**PCI express (PCIE) Slots:** The best type of expansion slot to have in your PC is the PCI Express. The PCI Express type of expansion slot communicates with the motherboard, and therefore with the microprocessor, both quickly and efficiently.

**AGP (Accelerated Graphics Port) Slot:** This type of expansion slot was specifically designed to deal with graphics adapters. In fact, AGP stands for Accelerated Graphics Port. Older PCs may sport this expansion slot, but the best video cards use PCI Express.

## 5. SMPs

A switched-mode power supply (SMPs) is an electronic circuit that converts power using switching devices that are turned on and off at high frequencies, and storage components such as inductors or capacitors to supply power when the switching device is in its non-conduction state.

Switching power supplies have high efficiency and are widely used in a variety of electronic equipment, including computers and other sensitive equipment requiring stable and efficient power supply.

A switched-mode power supply is also known as a switch-mode power supply or switching-mode power supply.

Switched-mode power supplies are classified according to the type of input and output voltages. The four major categories are:

- AC to DC
- DC to DC
- DC to AC
- AC to AC

## **6. INTERNAL STORAGE DEVICES**

Some storage devices are classed as 'internal' which means they are inside the computer case. Most computers have some form of internal storage. The most common type of internal storage is the hard disk. At the most basic level, internal storage is needed to hold the operating system so that the computer is able to access the input and output devices. It will also be used to store the applications software that you use and more than likely, the original copies of your data files. Internal storage allows the data and applications to be loaded very rapidly into memory, ready for use. The data can be accessed much faster than data which is stored on an external storage device. This is because internal storage devices are connected directly to the motherboard and its data bus whereas external devices are connected through a hardware interface such as USB, which means they are considerably slower to access.

Internal storage also means that if the computer is moved around, it will still retain its most commonly used data. The main disadvantage of internal storage is that when the hard disk fails (and it will), all the data and applications may be lost. This can be avoided to some extent by using more than one hard disk within the machine. Each hard disk has a copy of all the data, so if one fails the other can carry on. This is called a RAID array. An alternative is to use external drives for backup.

## **7. Interfacing Ports**

A Computer Port is an interface or a point of connection between the computer and its peripheral devices. Some of the common peripherals are mouse, keyboard, monitor or display unit, printer, speaker, flash drive etc. The main function of a computer port is to act as a point of attachment, where the cable from the peripheral can be plugged in and allows data to flow from and to the device.

### **Types of ports: -**

**Serial Port:** used for external modems and older computer mouse.

**Parallel Port:** used for scanners and printers.

**PS/2 Port:** used for old computer keyboard and mouse.

**Universal Serial Bus (or USB) Port:** It can connect all kinds of external USB devices such as external hard disk, printer, scanner, mouse, keyboard, etc.

**VGA Port:** connects monitor to a computer's video card. It has 15 holes. Similar to the serial port connector. However, serial port connector has pins, VGA port has holes.

**Power Connector:** connects to the computer's power cable that plugs into a power bar or wall socket.

**Modem Port:** connects a PC's modem to the telephone network.

**Ethernet Port:** connects to a network and high speed Internet. Connects the network cable to a computer.

**Game Port:** connect a joystick to a PC. Now replaced by USB Digital Video Interface

**DVI port:** connects Flat panel LCD monitor to the computer's high-end video graphic cards.

**Sockets:** sockets connect the microphone and speakers to the sound card of the computer.

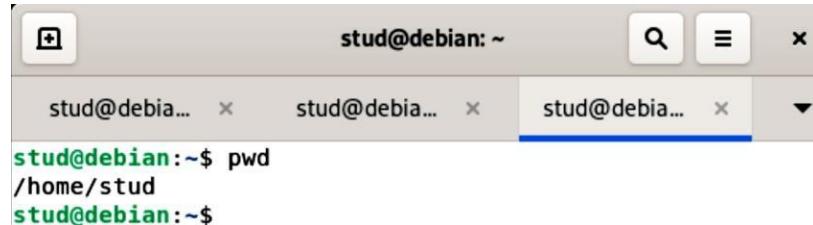

## **EXPERIMENT – 2**

### **LINUX COMMANDS**

#### **1. pwd**

The pwd command is used to display the location of the current working directory

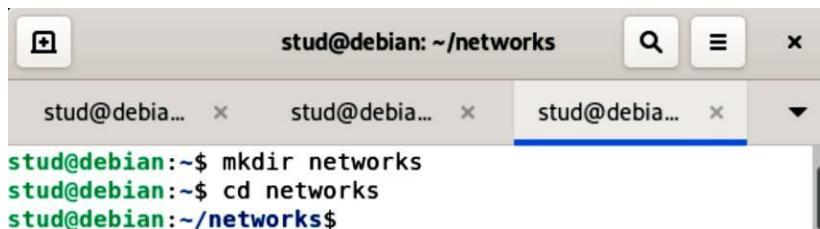

A screenshot of a terminal window titled "stud@debian: ~". It shows three tabs open. The active tab displays the command "stud@debian:~\$ pwd" followed by the output "/home/stud".

```
stud@debian:~$ pwd
/home/stud
stud@debian:~$
```

#### **2. mkdir**

The mkdir command is used to create a new directory under any directory

A screenshot of a terminal window titled "stud@debian: ~/networks". It shows three tabs open. The active tab displays the commands "stud@debian:~\$ mkdir networks", "stud@debian:~\$ cd networks", and "stud@debian:~/networks\$".

```
stud@debian:~$ mkdir networks
stud@debian:~$ cd networks
stud@debian:~/networks$
```

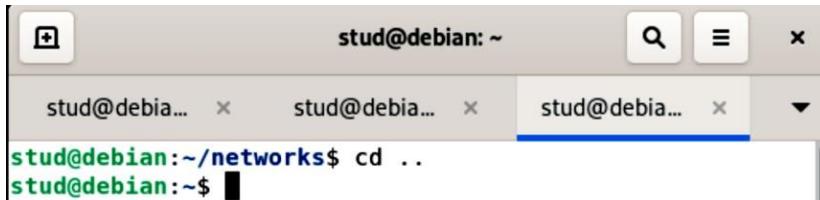

#### **3. cd**

The cd command is used to change the current directory

A screenshot of a terminal window titled "stud@debian: ~/networks". It shows three tabs open. The active tab displays the command "stud@debian:~\$ cd networks" followed by "stud@debian:~/networks\$".

```
stud@debian:~$ cd networks
stud@debian:~/networks$
```

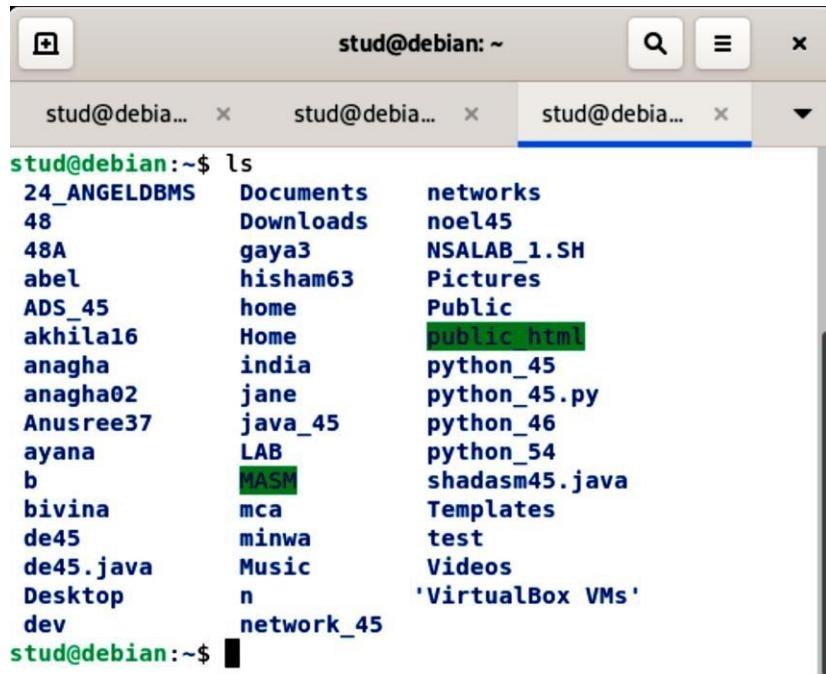

A screenshot of a terminal window titled "stud@debian: ~". It shows three tabs open. The active tab displays the command "stud@debian:~/networks\$ cd .." followed by "stud@debian:~\$".

```
stud@debian:~/networks$ cd ..
stud@debian:~$
```

#### 4. ls

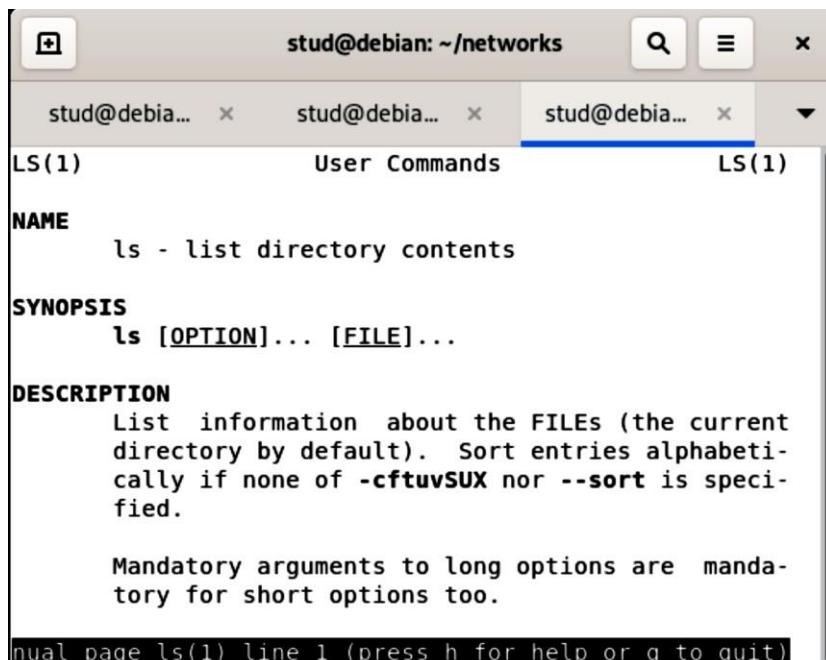

The ls command is used to display a list of content of a directory.

```
stud@debian:~$ ls
24_ANGELDBMS  Documents      networks
48            Downloads      noel45
48A           gaya3        NSALAB_1.SH
abel          hisham63     Pictures
ADS_45         home        Public
akhila16       Home        public html
anagha        india        python_45
anagha02       jane        python_45.py

de45.java     Music        Videos
Desktop        n           'VirtualBox VMs'
dev            network_45
stud@debian:~$
```

#### 5. man

The man command is used to display the user manual of any command that we can run on the terminal.

```
stud@debian:~/networks
LS(1)          User Commands          LS(1)

NAME
    ls - list directory contents

SYNOPSIS
    ls [OPTION]... [FILE]...

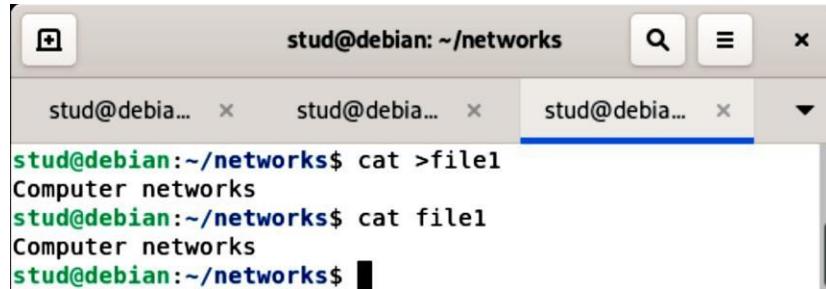

DESCRIPTION
    List information about the FILEs (the current
    directory by default). Sort entries alphabeti-
    cally if none of -cftuvSUX nor --sort is speci-
    fied.

    Mandatory arguments to long options are manda-
    tory for short options too.

Manual page ls(1) line 1 (press h for help or q to quit)
```

## 6. cat

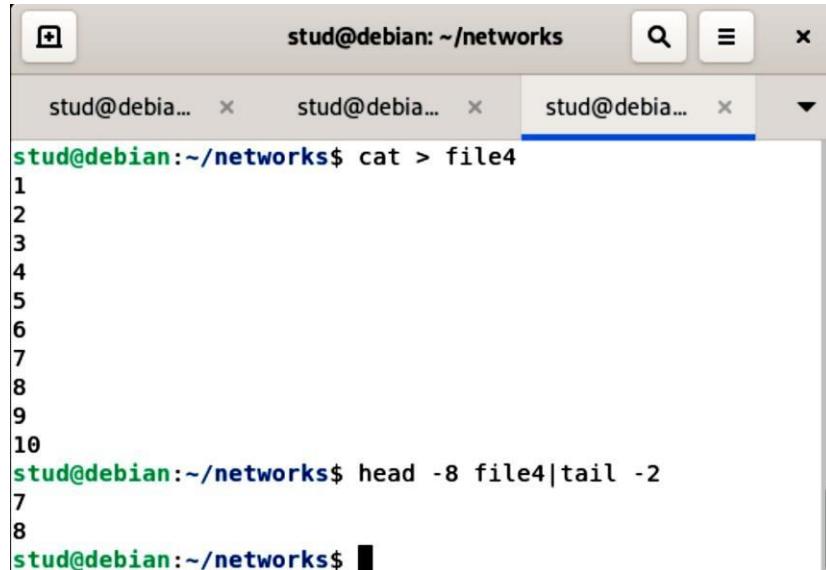

The cat command is a multi-purpose utility in the Linux system. It can be used to create a file, display content of the file, copy the content of one file to another file, and more.

```
stud@debian:~/networks$ cat >file1
Computer networks
stud@debian:~/networks$ cat file1
Computer networks
stud@debian:~/networks$
```

## 7. head and tail

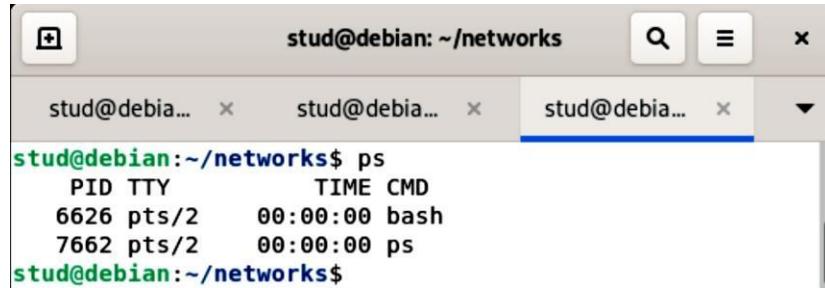

The head command is used to display the content of a file. It displays the first 10 lines of a file. The tail command is similar to the head command. The difference between both commands is that it displays the last ten lines of the file content. It is useful for reading the error message.

```
stud@debian:~/networks$ cat > file4
1
2
3
4
5
6
7
8
9
10
stud@debian:~/networks$ head -8 file4|tail -2
7
8
stud@debian:~/networks$
```

## 8. ps

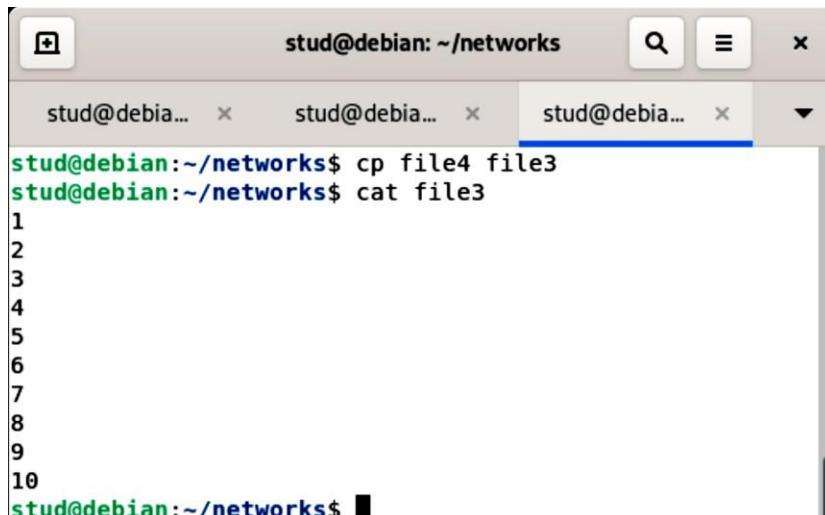

The ps command is used to know the currently working process.

```
stud@debian: ~/networks
stud@debian:~/networks$ ps
 PID TTY      TIME CMD
 6626 pts/2    00:00:00 bash
 7662 pts/2    00:00:00 ps
stud@debian:~/networks$
```

## 9. cp

The cp command is used to copy a file or directory.

```
stud@debian: ~/networks
stud@debian:~/networks$ cp file4 file3
stud@debian:~/networks$ cat file3
1
2
3
4
5
6
7
8
9
10
stud@debian:~/networks$
```

## 10. Touch

The touch command is used to create empty files. We can create multiple empty files by executing it once.

```
stud@debian: ~/networks
stud@debian:~/networks$ touch file3.txt
stud@debian:~/networks$
```

## 11. rm

The rm command is used to remove a file.

```
stud@debian: ~/networks
stud@debian: ~
stud@debian: ~
stud@debian:~/networks$ touch file3.txt
stud@debian:~/networks$
```

## 12. rmdir

The rmdir command is used to delete a directory.

```
stud@debian: ~
stud@debian:~$ mkdir nsa
stud@debian:~$ rmdir nsa
stud@debian:~$
```

## 13. rename

The rename command is used to rename files. It is useful for renaming a large group of files.

```
stud@debian: ~
stud@debian:~$ cat > state
kerala
tamilnadu
stud@debian:~$ mv state file3
stud@debian:~$ cat file3
kerala
tamilnadu
stud@debian:~$
```

## 14. more

The more command is quite similar to the cat command, as it is used to display the file content in the same way that the cat command does.

```
stud@debian: ~
stud@debian:~$ more file3
kerala
tamilnadu
stud@debian:~$
```

## 15. less

The less command is similar to the more command. It also includes some extra features such as 'adjustment in width and height of the terminal.

```
stud@debian:~$ more file3
kerala
tamilnadu
stud@debian:~$
```

## 16. sort

The more command is quite similar to the cat command, as it is used to display the file content in the same way that the cat command does.

```
stud@debian:~$ sort file3
kerala
tamilnadu
stud@debian:~$
```

## 17. wc

The wc command is used to count the lines, words, and characters in a file.

```
stud@debian:~$ wc file3
2 2 17 file3
stud@debian:~$
```

## 18. sed

The sed command is used to edit files using a regular expression. It does not permanently edit files.

```
stud@debian:~$ wc file3
2 2 17 file3
stud@debian:~$
```

## 19. grep

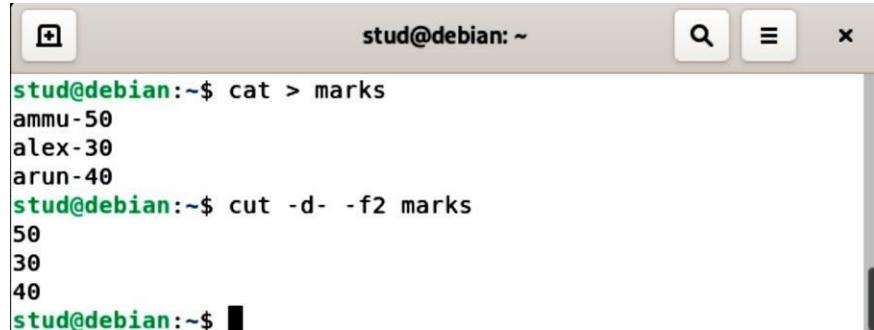

The grep is useful for searching the content from a file. Generally, it is used with the pipe.

```
stud@debian:~$ cat > hello
hello hai
hello welcome
stud@debian:~$ grep "hello" hello
hello hai
hello welcome
stud@debian:~$
```

## 20. cut

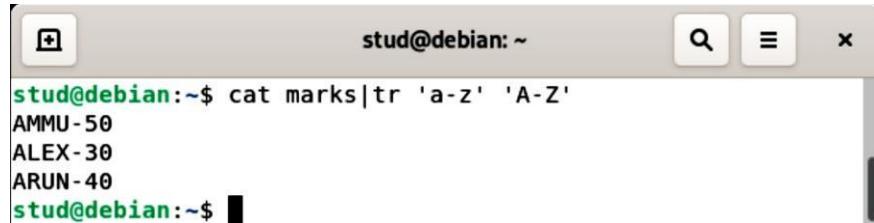

The cut command is used to select a specific column of a file. The '-d' option is used as a delimiter, and it can be a space (' '), a slash (/), a hyphen (-), or anything else. And, the '-f' option is used to specify a column number.

```
stud@debian:~$ cat > marks
ammu-50
alex-30
arun-40
stud@debian:~$ cut -d- -f2 marks
50
30
40
stud@debian:~$
```

## 21. tr

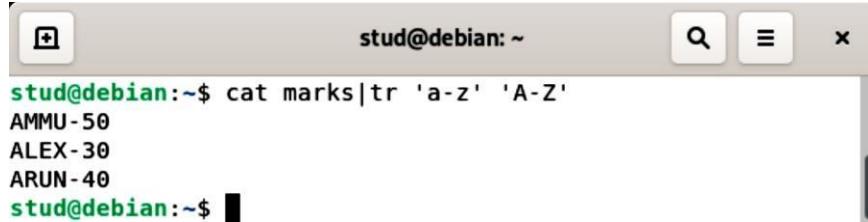

The tr command is used to translate the file content like from lower case to upper case.

```
stud@debian:~$ cat marks|tr 'a-z' 'A-Z'
AMMU-50
ALEX-30
ARUN-40
stud@debian:~$
```

## 22. paste

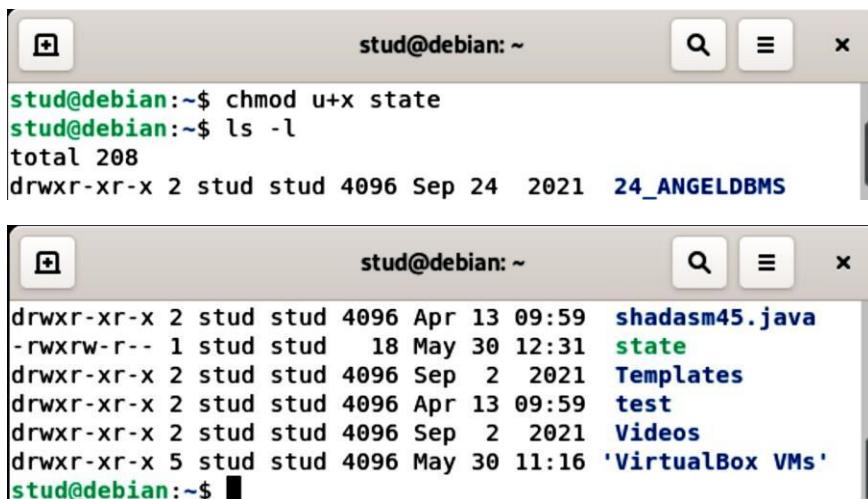

Paste is used to join files horizontally (parallel merging) by outputting lines consisting of lines from each file specified.

```
stud@debian:~$ cat marks|tr 'a-z' 'A-Z'
AMMU-50
ALEX-30
ARUN-40
stud@debian:~$
```

## 23. ch mod

chmod command is used to change the access permissions of files and directories.

```
stud@debian:~$ chmod u+x state
stud@debian:~$ ls -l
total 208
drwxr-xr-x 2 stud stud 4096 Sep 24 2021 24_ANGELDBMS

stud@debian:~$ ls -l
drwxr-xr-x 2 stud stud 4096 Apr 13 09:59 shadasm45.java
-rwxrw-r-- 1 stud stud 18 May 30 12:31 state
drwxr-xr-x 2 stud stud 4096 Sep 2 2021 Templates
drwxr-xr-x 2 stud stud 4096 Apr 13 09:59 test
drwxr-xr-x 2 stud stud 4096 Sep 2 2021 Videos
drwxr-xr-x 5 stud stud 4096 May 30 11:16 'VirtualBox VMs'
stud@debian:~$
```

## **EXPERIMENT – 3**

### **LINUX FILE SYSTEM**

It makes sense to explore the Linux filesystem from a terminal window, In fact, that is the name of the first tool you'll install to help you on the way: tree. If you are using Ubuntu or Debian, you can do: sudo apt install tree Once installed, stay in your terminal window and run tree like this: \$ tree /.

The / in the instruction above refers to the root directory. The root directory is the one from which all other directories branch off from. When you run tree and tell it to start with /, you will see the whole directory tree, all directories and all the subdirectories in the whole system, with all their files, fly by.

If you have been using your system for some time, this may take a while, because, even if you haven't generated many files yourself, a Linux system and its apps are always logging, caching, and storing temporary files. The number of entries in the file system can grow quite quickly.

Instead, try this: tree -L 1 / And you should see a listing similar to what is shown in Figure 1.

```
sunil@debian:~$ tree -L 1 /
/
├── bin  -> usr/bin
├── boot
├── dev
├── etc
├── home
├── initrd.img  -> boot/initrd.img-4.19.0-14-amd64
├── initrd.img.old  -> boot/initrd.img-4.19.0-13-amd64
├── lib  -> usr/lib
├── lib32  -> usr/lib32
├── lib64  -> usr/lib64
├── libx32  -> usr/libx32
├── lost+found
├── media
├── mnt
├── opt
├── proc
├── root
├── run
├── sbin  -> usr/sbin
├── snap
├── srv
├── sys
├── tmp
├── usr
└── var
├── vmlinuz  -> boot/vmlinuz-4.19.0-14-amd64
└── vmlinuz.old  -> boot/vmlinuz-4.19.0-13-amd64

23 directories, 4 files
sunil@debian:~$
```

The instruction above can be translated as “show me only the 1st Level of the directory tree starting at / (root)“. The -L option tells tree how many levels down you want to see. Most Linux distributions will show you the same or a very similar layout to what you can see in the image above. This means that even if you feel confused now, master this, and you will have a handle on most, if not all, Linux installations in the whole wide world.

Now, let’s look at what each directory is used for. While we go through each, you can peek at their contents using ls.

### **Directories**

From top to bottom, the directories you are seeing are as follows.

#### **/bin**

/bin is the directory that contains binaries, that is, some of the applications and programs you can run. You will find the ls program mentioned above in this directory, as well as other basic tools for making and removing files and directories, moving them around, and so on. There are more bin directories in other parts of the file system tree, but we’ll be talking about those in a minute.

#### **/boot**

The /boot directory contains files required for starting your system. If you mess up one of the files in here, you may not be able to run your Linux and it is a pain to repair. On the other hand, don’t worry too much about destroying your system by accident: you have to have superuser privileges to do that.

#### **/dev**

/dev contains device files. Many of these are generated at boot time or even on the fly. For example, if you plug in a new webcam or a USB pendrive into your machine, a new device entry will automatically pop up here.

#### **/etc**

/etc is the directory where names start to get confusing. /etc gets its name from the earliest Unixes and it was literally “et cetera” because it was the dumping ground for system files administrators were not sure where else to put.

Nowadays, it would be more appropriate to say that etc stands for “Everything to configure,” as it contains most, if not all system-wide configuration files. For example, the files that contain the name of your system, the users and their passwords, the names of machines on your network and when and where the partitions on your hard disks should be mounted are all in here. Again, if you are new to Linux, it may be best if you don’t touch too much in here until you have a better understanding of how things work.

## /home

/home is where you will find your users' personal directories. In my case, under /home there are two directories: /home/paul, which contains all my stuff; and /home/guest, in case anybody needs to borrow my computer.

## /lib

/lib is where libraries live. Libraries are files containing code that your applications can use. They contain snippets of code that applications use to draw windows on your desktop, control peripherals, or send files to your hard disk.

There are more lib directories scattered around the file system, but this one, the one hanging directly off of / is special in that, among other things, it contains the all-important kernel modules. The kernel modules are drivers that make things like your video card, sound card, WiFi, printer, and so on, work.

## /media

The /media directory is where external storage will be automatically mounted when you plug it in and try to access it. As opposed to most of the other items on this list, /media does not hail back to 1970s, mainly because inserting and detecting storage (pendrives, USB hard disks, SD cards, external SSDs, etc) on the fly, while a computer is running, is a relatively new thing.

## /mnt

The /mnt directory, however, is a bit of remnant from days gone by. This is where you would manually mount storage devices or partitions. It is not used very often nowadays.

## /opt

The /opt directory is often where software you compile (that is, you build yourself from source code and do not install from your distribution repositories) sometimes lands. Applications will end up in the /opt/bin directory and libraries in the /opt/lib directory. A slight digression: another place where applications and libraries end up in is /usr/local. When software gets installed here, there will also be /usr/local/bin and /usr/local/lib directories. What determines which software goes where is how the developers have configured the files that control the compilation and installation process.

## /proc

/proc, like /dev is a virtual directory. It contains information about your computer, such as information about your CPU and the kernel your Linux system is running. As with /dev, the files and directories are generated when your computer starts, or on the fly, as your system is running and things change.

**/root**

/root is the home directory of the superuser (also known as the “Administrator”) of the system. It is separate from the rest of the users’ home directories BECAUSE YOU ARE NOT MEANT TO TOUCH IT. Keep your own stuff in you own directories, people.

**/run**

/run is another new directory. System processes use it to store temporary data for their own nefarious reasons.

**/sbin**

/sbin is similar to /bin, but it contains applications that only the superuser (hence the initial s) will need. You can use these applications with the sudo command that temporarily concedes you superuser powers on many distributions. /sbin typically contains tools that can install stuff, delete stuff and format stuff. As you can imagine, some of these instructions are lethal if you use them improperly, so handle with care.

**/usr**

The /usr directory was where users’ home directories were originally kept back in the early days of UNIX. However, now /home is where users kept their stuff as we saw above. These days, /usr contains a mish-mash of directories which in turn contain applications, libraries, documentation, wallpapers, icons and a long list of other stuff that need to be shared by applications and services. You will also find bin, sbin and lib directories in /usr. What is the difference with their roothanging cousins? Not much nowadays. Originally, the /bin directory (hanging off of root) would contain very basic commands, like ls, mv and rm; the kind of commands that would come pre-installed in all UNIX/Linux installations, the bare minimum to run and maintain a system. /usr/bin on the other hand would contain stuff the users would install and run to use the system as a work station, things like word processors, web browsers, and other apps. But many modern Linux distributions just put everything into /usr/bin and have /bin point to /usr/bin just in case erasing it completely would break something. So, while Debian, Ubuntu and Mint still keep /bin and /usr/bin (and /sbin and /usr/sbin) separate; others, like Arch and its derivatives just have one “real” directory for binaries, /usr/bin, and the rest or \*bins are “fake” directories that point to /usr/bin.

**/srv**

The /srv directory contains data for servers. If you are running a web server from your Linux box, your HTML files for your sites would go into /srv/http (or /srv/www). If you were running an FTP server, your files would go into /srv/ftp.

**/sys**

/sys is another virtual directory like /proc and /dev and also contains information from devices connected to your computer. In some cases you can also manipulate those devices. I can, for example, change the brightness of the screen of my laptop by modifying the value

stored in the /sys/devices/pci0000:00/0000:00:02.0/drm/card1/card1-eDP-1/intel\_backlight/brightness file (on your machine you will probably have a different file). But to do that you have to become superuser. The reason for that is, as with so many other virtual directories, messing with the contents and files in /sys can be dangerous and you can trash your system. DO NOT TOUCH until you are sure you know what you are doing.

### **/tmp**

/tmp contains temporary files, usually placed there by applications that you are running. The files and directories often (not always) contain data that an application doesn't need right now, but may need later on.

You can also use /tmp to store your own temporary files — /tmp is one of the few directories hanging off / that you can actually interact with without becoming superuser.

### **/var**

/var was originally given its name because its contents was deemed variable, in that it changed frequently. Today it is a bit of a misnomer because there are many other directories that also contain data that changes frequently, especially the virtual directories we saw above. Be that as it may, /var contains things like logs in the /var/log subdirectories. Logs are files that register events that happen on the system. If something fails in the kernel, it will be logged in a file in /var/log; if someone tries to break into your computer from outside, your firewall will also log the attempt here. It also contains spools for tasks. These “tasks” can be the jobs you send to a shared printer when you have to wait because another user is printing a long document, or mail that is waiting to be delivered to users on the system.

Your system may have some more directories we haven't mentioned above. In the screenshot, for example, there is a /snap directory. That's because the shot was captured on an Ubuntu system. Ubuntu has recently incorporated snap packages as a way of distributing software. The /snap directory contains all the files and the software installed from snaps.

/var/log/syslog contains lot of system related logfiles.

Figure 2: Standard Unix filesystem hierarchy.

To explore the filesystem yourself, use the cd command:

## cd

will take you to the directory of your choice (cd stands for change directory). If you get confused,

## pwd

will always tell you where you (pwd stands for print working directory). Also, cd with no options or parameters, will take you back to your own home directory, where things are safe and cosy.

## cd ..

will take you up one level, getting you one level closer to the / root directory. If you are in /usr/share/wallpapers and run cd .., you will move up to /usr/share.

To see what a directory contains, use

## ls

to list the contents of the directory you are in right now.

And, of course, you always have tree to get an overview of what lays within a directory. Try it on /usr/share — there is a lot of interesting stuff in there.

Although there are minor differences between Linux distributions, the layout for their filesystems are mercifully similar. So much so that you could say: once you know one, you know them all. And the best way to know the filesystem is to explore it. So go forth with tree, ls, and cd into uncharted territory.

You cannot damage your filesystem just by looking at it, so move from one directory to another and take a look around.

## **EXPERIMENT - 4**

### **SHELL PROGRAMMING**

#### **Experiment no.1**

Write a shell script to find the sum, the average and the product of the four integers entered.

#### **Shell Script**

```
echo "Enter four integers"  
read a b c d  
sum=`expr $a + $b + $c + $d`  
echo "Sum      = $sum"  
avg=`expr $sum / 4`  
echo "Average = $avg"  
pro=`expr $a \* $b \* $c \* $d`  
echo "Product = $pro"
```

#### **Output**

A screenshot of a terminal window titled "stud@debian: ~/1CN". The window shows the command "bash 1.sh" being run, followed by the program's output. The output displays the user entering four integers (23, 45, 54, 12), and the program calculating the Sum (134), Average (33), and Product (670680).

```
stud@debian:~/1CN$ bash 1.sh  
Enter four integers  
23 45 54 12  
Sum      = 134  
Average = 33  
Product = 670680  
stud@debian:~/1CN$ _
```

### **Experiment no.2**

- a) Write a program to check whether a number entered is odd or even.

#### **Shell Script**

```
echo "enter a number"  
read a  
if [ `expr $a % 2` -eq 0 ]  
then  
echo "even number"  
else  
echo "odd number"  
fi
```

- b) Write a shell script to print given number in reverse order.

#### **Shell Script**

```
echo "Enter a number"  
read s  
r=0  
d=0  
while [ $s -gt 0 ]  
do  
d=$((s % 10))  
r=$((r * 10 + d))  
s=$((s / 10))  
done  
echo "Reverse = $r"
```

c) Write a shell script to print sum of all digits of a given number

### Shell Script

```
echo "Enter a number"
read s
r=0
d=0
while [ $s -gt 0 ]
do
d=$((s % 10))
r=$((r + d))
s=$((s / 10))
done
echo "Sum of digits = $r"
```

### Output

The screenshot shows a terminal window with the following session:

```
stud@debian:~/1CN$ bash 2a.sh
enter a number
46
even number
stud@debian:~/1CN$ bash 2b.sh
Enter a number
234
Reverse = 432
stud@debian:~/1CN$ bash 2c.sh
Enter a number
438
Sum of digits = 15
stud@debian:~/1CN$
```

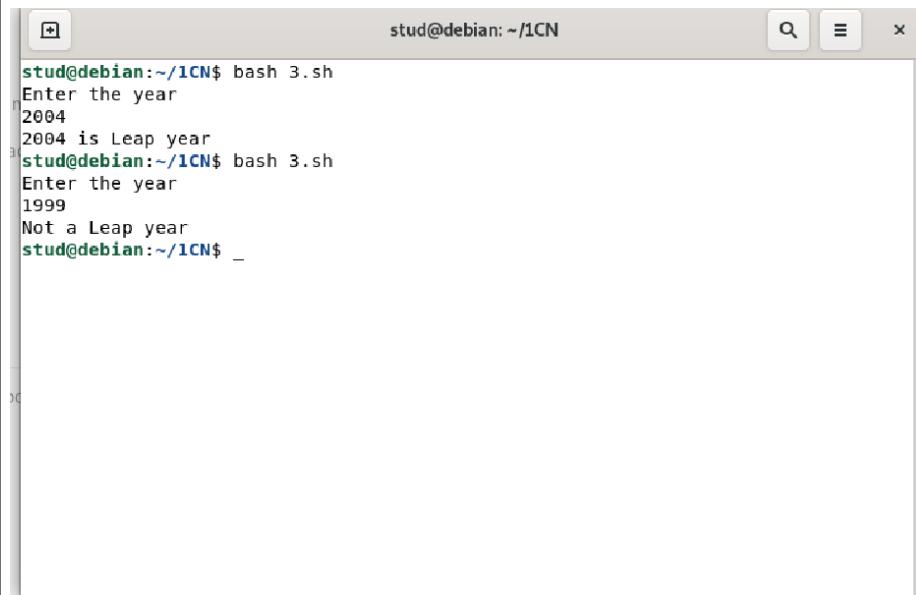

### **Experiment no.3**

Write a shell script that accepts any year from the keyboard and determine whether the year is a leap year or not.

#### **Shell Script**

```
echo "Enter the year"  
read y  
if [ `expr $y % 4` -eq 0 ] && [ `expr $y % 100` -ne 0 ] || [ `expr $y % 400` -eq 0 ]  
then  
echo "$y is Leap year"  
else  
echo "Not a Leap year"  
fi
```

#### **Output**

The screenshot shows a terminal window titled "stud@debian: ~/1CN". It displays two executions of the script:

```
stud@debian:~/1CN$ bash 3.sh  
Enter the year  
2004  
2004 is Leap year  
stud@debian:~/1CN$ bash 3.sh  
Enter the year  
1999  
Not a Leap year  
stud@debian:~/1CN$ _
```

## **Experiment no.4**

Write a shell script to find the factorial of a number

### **Shell Script**

```
echo "Enter a number"
```

```
read n
```

```
i=1
```

```
f=1
```

```
while [ $i -le $n ]
```

```
do
```

```
f=$(( $f * $i ))
```

```
i=$(( $i + 1 ))
```

```
done
```

```
echo "Factorial : $f"
```

### **Output**

The screenshot shows a terminal window titled 'stud@debian: ~/1CN'. The command 'bash 4.sh' is run, followed by the input '6'. The output shows the factorial of 6, which is 720.

```
stud@debian:~/1CN$ bash 4.sh
Enter a number
6
Factorial : 720
stud@debian:~/1CN$
```

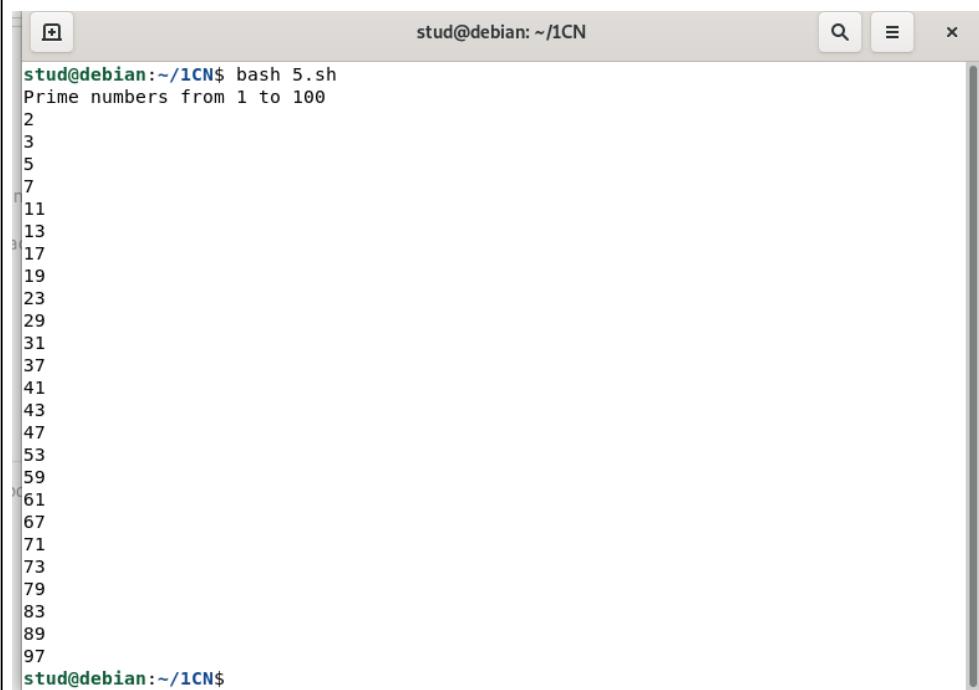

### **Experiment no.5**

Write a program to print prime numbers from 1 to 100

#### **Shell Script**

```
echo "Prime numbers from 1 to 100"
for (( i=2; i<=100; i++ ))
do
f=0
for (( j=2; j<$i; j++ ))
do
x=`expr $i % $j`
if [ $x -eq 0 ]
then
f=1
break
fi
done
if [ $f -eq 0 ]
then
echo $i
fi
done
```

## Output

A screenshot of a terminal window titled "stud@debian: ~/1CN". The window shows the output of a command: "stud@debian:~/1CN\$ bash 5.sh". The output lists prime numbers from 1 to 100, starting with 2 and ending with 97. The terminal has a light gray background and dark gray borders. The text is black.

```
stud@debian:~/1CN$ bash 5.sh
Prime numbers from 1 to 100
2
3
5
7
11
13
17
19
23
29
31
37
41
43
47
53
59
61
67
71
73
79
83
89
97
stud@debian:~/1CN$
```

## **Experiment no.6**

Write a script for Printing Numbers in ascending Order

### **Shell Script**

```
echo "Enter file name"  
read f  
sort -n $f>f1  
cat f1
```

### **Output**

The screenshot shows a terminal window titled "stud@debian: ~/1CN". It displays the execution of a shell script named "6.sh". The script reads a file named "num" containing the numbers 23, 78, 3, 4, 70, 21, 22, 3, 34, 31, and then prints them back out in ascending order: 3, 3, 4, 21, 22, 23, 31, 34, 70, 78.

```
stud@debian:~/1CN$ cat>num  
23  
78  
3  
4  
70  
21  
22  
3  
34  
31  
stud@debian:~/1CN$ bash 6.sh  
Enter file name  
num  
3  
3  
4  
21  
22  
23  
31  
34  
70  
78  
stud@debian:~/1CN$ _
```

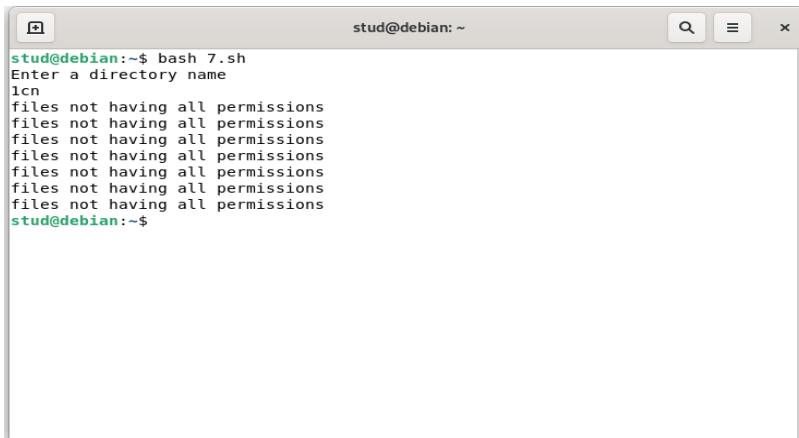

### **Experiment no.7**

Write a shell script which displays a list of files in the current directory to which we have read write and execute permissions.

#### **Shell Script**

```
read dir  
if [ -d $dir ]  
then  
cd $dir  
ls > f  
exec<f  
while read line  
do  
if [ -f $line ]  
then  
if [ -r $line -a -w $line -a -x $line ]  
then  
echo "$line has all permissions"  
else  
echo "files not having all permissions"  
fi  
fi  
done  
fi
```

## Output

A screenshot of a terminal window titled "stud@debian: ~". The window contains the following text:

```
stud@debian:~$ bash 7.sh
Enter a directory name
lcn
files not having all permissions
stud@debian:~$
```

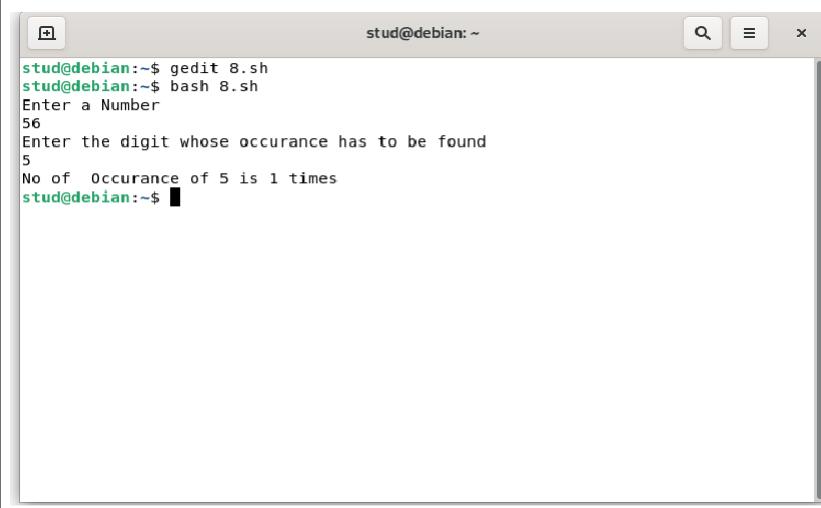

## Experiment no.8

Write a shell script to find the number of occurrence of particular digit in an inputted number

### Shell Script

```
c=0
echo "Enter a Number "
read n
x=$n
echo "Enter the digit whose occurrence has to be found "
read a
while [ $n -ne 0 ]
do
    d=`expr $n % 10`
    if [ $d -eq $a ]
    then
        c=`expr $c + 1`
    fi
    n=`expr $n / 10 `
done
echo "No of Occurrence of $d is $c times"
```

### Output

The screenshot shows a terminal window titled 'stud@debian: ~'. The session starts with the command 'gedit 8.sh' followed by 'bash 8.sh'. The user then enters the number '56' and the digit '5' to search for. The output shows that the digit '5' appears once in the number '56'.

```
stud@debian:~$ gedit 8.sh
stud@debian:~$ bash 8.sh
Enter a Number
56
Enter the digit whose occurrence has to be found
5
No of Occurrence of 5 is 1 times
stud@debian:~$
```

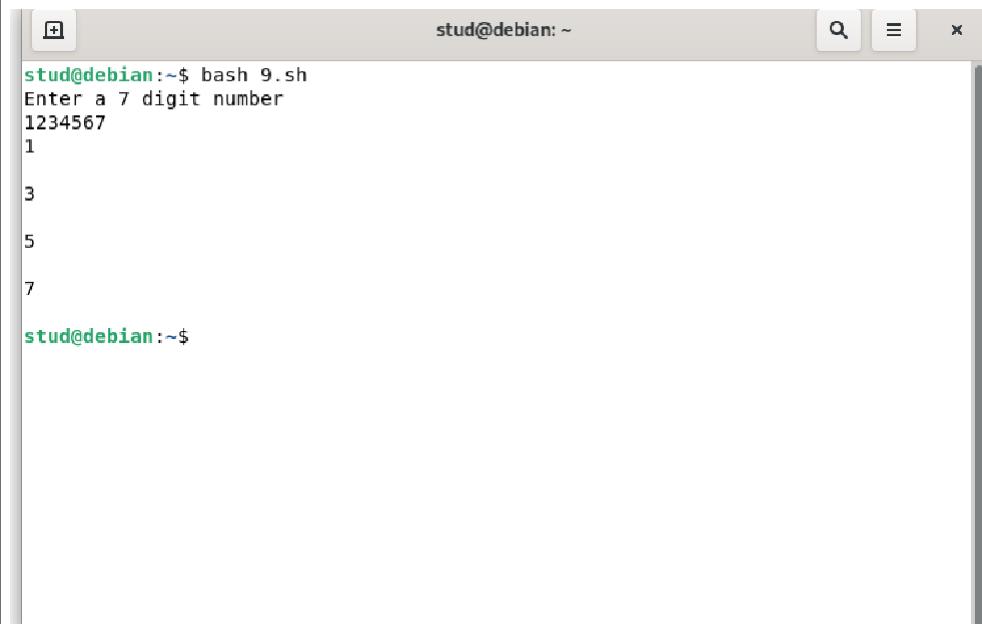

## **Experiment no.9**

Write shell script to print alternate digits when a 7-digit number is passed as input

### **Shell Script**

```
echo "Enter a 7 digit number"
read num
n=1
while [ $n -le 7 ]
do
a= echo $num | cut -c $n
echo $a
n=`expr $n + 2`
done
```

### **Output**

A screenshot of a terminal window titled "stud@debian: ~". The window shows the command "bash 9.sh" being run, followed by the prompt "Enter a 7 digit number". The user enters "1234567". The script then prints the alternate digits: "1", "3", "5", and "7". The terminal window has a standard Linux-style interface with a title bar, a scroll bar, and a status bar at the bottom.

```
stud@debian:~$ bash 9.sh
Enter a 7 digit number
1234567
1
3
5
7
```

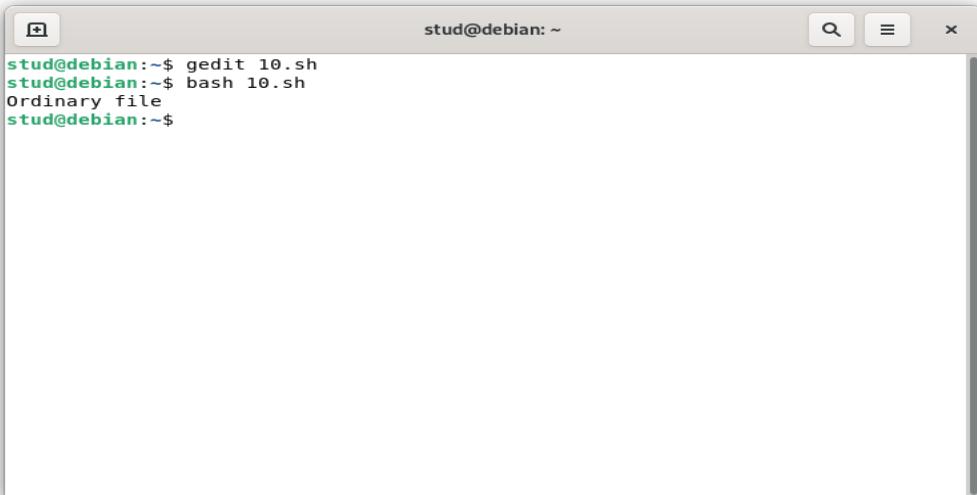

## **Experiment no.10**

Write A shell script that takes a command –line argument and reports on whether it is directory, a file, or something else

### **Shell Script**

```
if [ -f $1 ]
then
    echo "Ordinary file"
elif [ -d $1 ]
then
    echo "Directory file"
else
    echo "Does not exists"
fi
```

### **Output**

The screenshot shows a terminal window titled 'stud@debian: ~'. The terminal displays the following command-line session:

```
stud@debian:~$ gedit 10.sh
stud@debian:~$ bash 10.sh
Ordinary file
stud@debian:~$
```

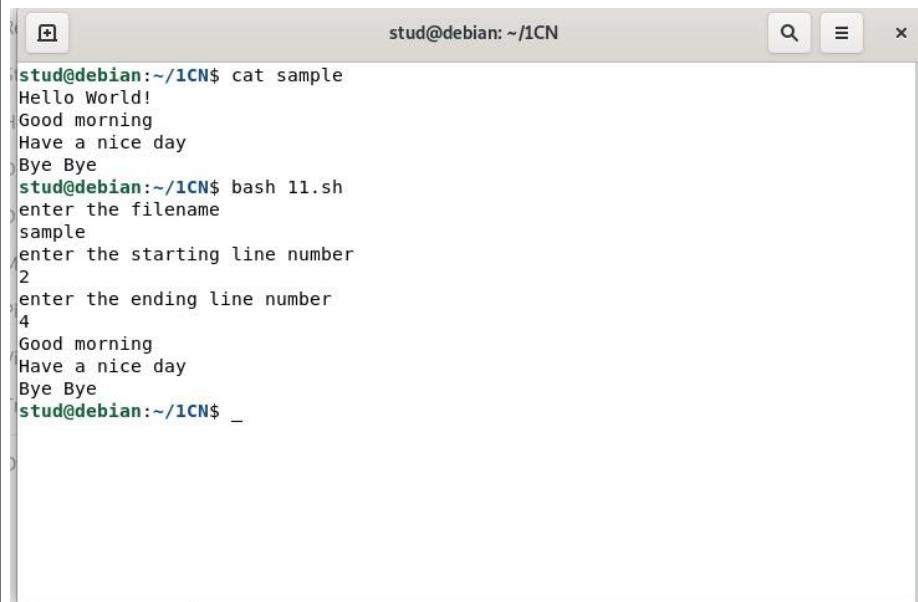

## **Experiment no.11**

Write a shell script that accepts a file name starting and ending line numbers as arguments and displays all the lines between the given line numbers

### **Shell Script**

```
echo "enter the filename"
read fname
echo "enter the starting line number"
read s
echo "enter the ending line number"
read n
sed -n $s,$n\p $fname |cat>new
cat new
```

### **Output**

The screenshot shows a terminal window titled 'stud@debian: ~/1CN'. The terminal displays the following session:

```
stud@debian:~/1CN$ cat sample
Hello World!
Good morning
Have a nice day
Bye Bye
stud@debian:~/1CN$ bash 11.sh
enter the filename
sample
enter the starting line number
2
enter the ending line number
4
Good morning
Have a nice day
Bye Bye
stud@debian:~/1CN$ _
```

## **Experiment no.12**

Write a shell script that deletes all lines containing a specified word in one or more files supplied as arguments to it.

### **Shell Script**

```
if [ $# -lt 2 ]
then
    echo "not enough
arguments"exit 1
fi

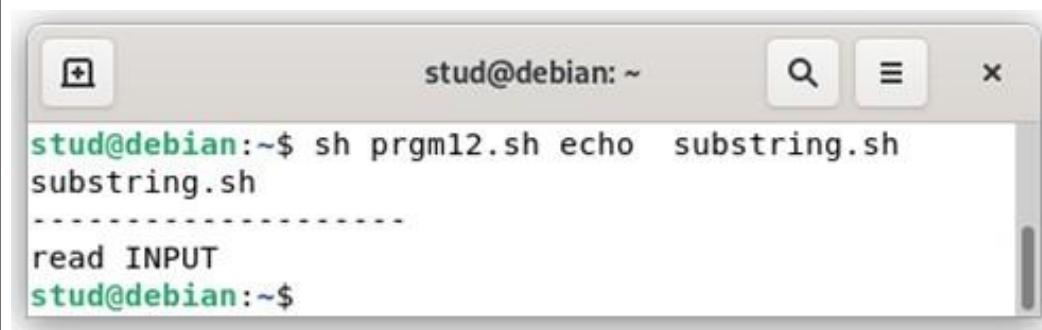

search_word=$1

for file_name in
"$@"do
    if [ "$file_name" =
"$1" ]then
        conti
        nuefi
        echo $file_name

        echo "....."if [ ! -f $file_name ] then
            echo "File \'$file_name\' does not
exist"exit 2
        fi

        sed "/$search_word/d" $file_name
done
```

### **Output**

A screenshot of a terminal window titled "stud@debian: ~". The window shows the command "sh prgm12.sh echo substring.sh" being run. The output of the script is displayed, showing the word "substr" removed from the input "substring".

```
stud@debian:~$ sh prgm12.sh echo substring.sh
-----
read INPUT
stud@debian:~$
```

### **Experiment no.13**

Write a shell script that computes the gross salary of an employee according to the following:

1) if basic salary is <1500 then HRA 10% of the basic and DA =90% of

the basic

2) if basic salary is >1500 then HRA 500 and DA =98% of the basic

The basic salary is entered interactively through the key board

### **Shell Script**

```
echo "Enter basic salary:"
```

```
read salary
```

```
if [ $salary -lt 15000 ]
```

```
then
```

```
hra=$(( $salary * 10/100 ))
```

```
da=$(( $salary * 40/100 ))
```

```
ded=$(( $salary * 10/100 ))
```

```
else
```

```
hra=$(( $salary * 20/100 ))
```

```
da=$(( $salary * 50/100))
```

```
ded=$(( $salary *20/100 ))
```

```
fi
```

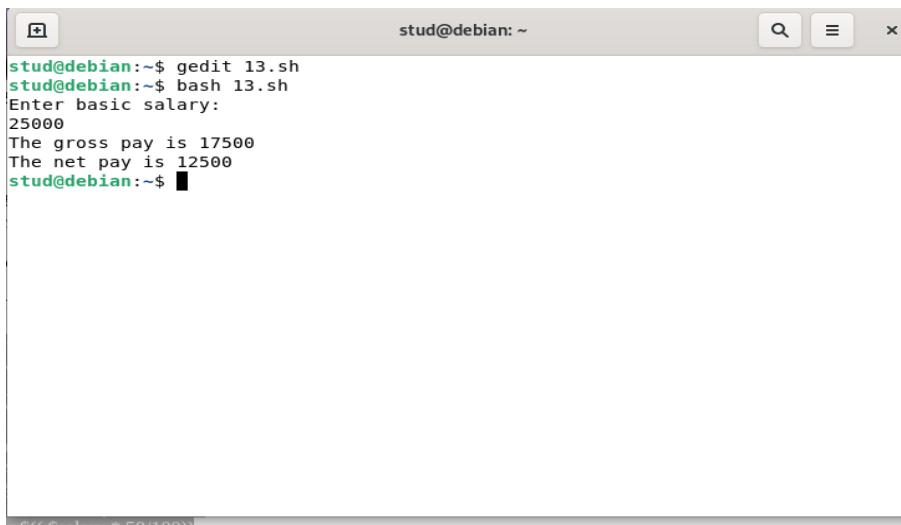

```
gp=$(( $hra + $da ))
```

```
np=$(( $gp - $ded))
```

```
echo "The gross pay is $gp"
```

```
echo "The net pay is $np"
```

## Output

A screenshot of a terminal window titled "stud@debian: ~". The window contains the following text:

```
stud@debian:~$ gedit 13.sh
stud@debian:~$ bash 13.sh
Enter basic salary:
25000
The gross pay is 17500
The net pay is 12500
stud@debian:~$ █
```

The terminal window has a standard Linux-style interface with a title bar, a menu bar, and a scroll bar on the right side.

## EXPERIMENT – 5

### Installing LAMP on Ubuntu

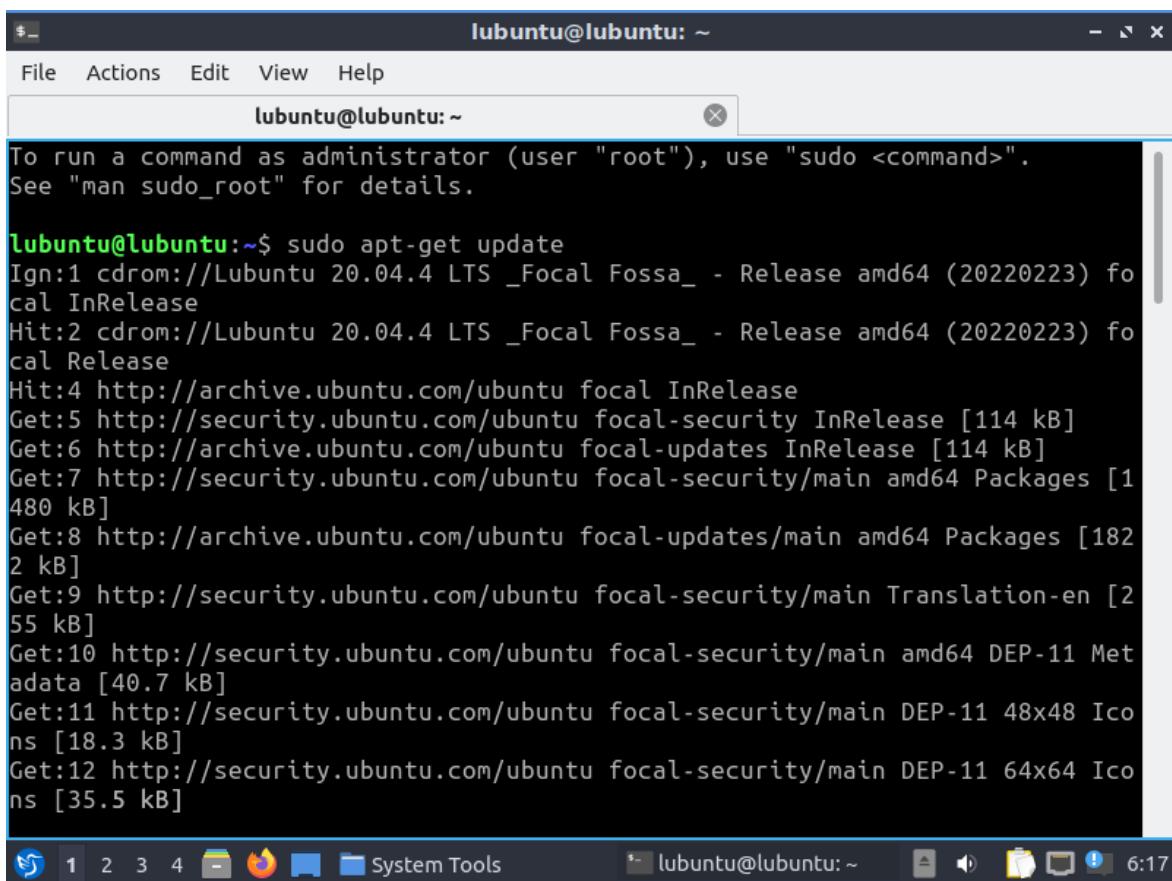

Step 1: Update Package Repository Cache

Before you begin:

1. Open the terminal either by using the **CTRL+ALT+T** keyboard shortcut or by searching for the word *terminal* in **Ubuntu**

2. Make sure to update the package repository cache to ensure it installs the latest versions of the software. To do so, type in the following command:

**sudo apt-get update**

The screenshot shows a terminal window titled "lubuntu@lubuntu: ~". The window contains the following text:

```
lubuntu@lubuntu:~$ sudo apt-get update
[...]
To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

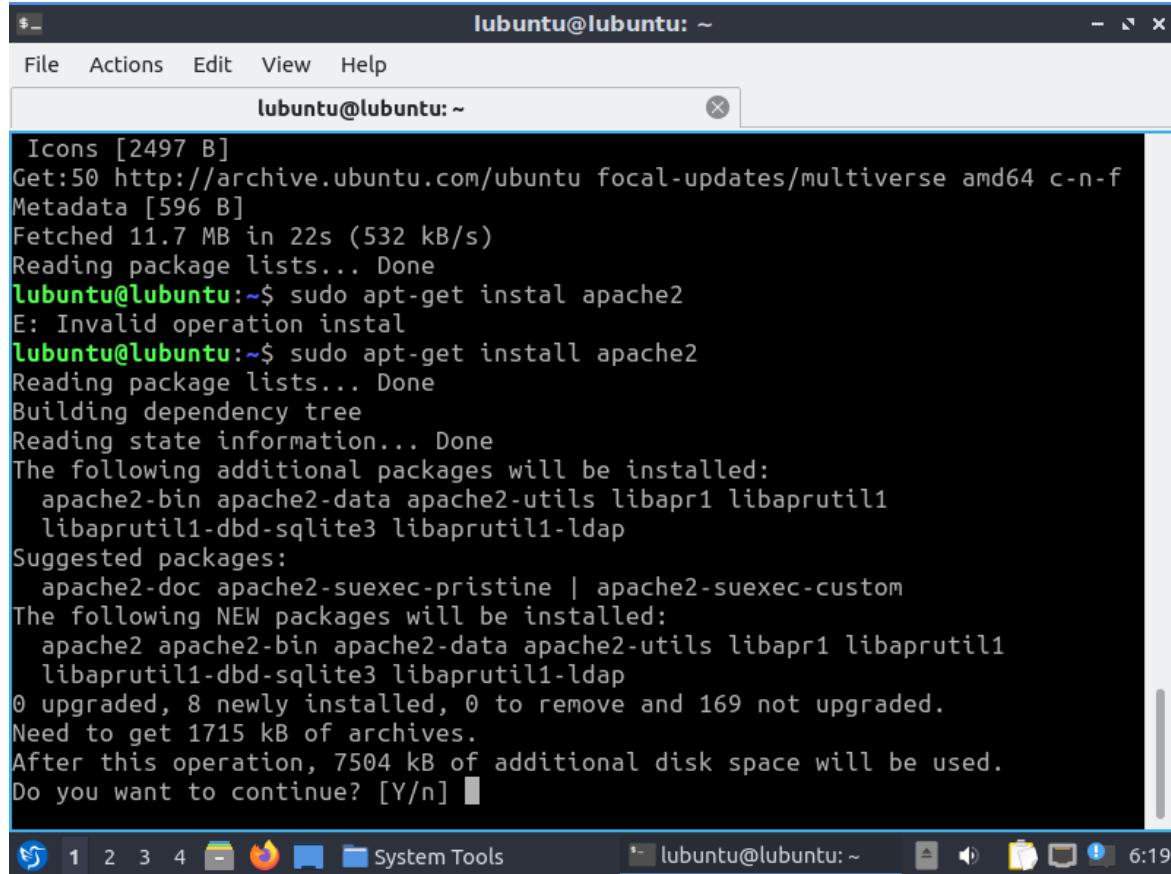

lubuntu@lubuntu:~$ sudo apt-get update
Ign:1 cdrom://Lubuntu 20.04.4 LTS _Focal Fossa_ - Release amd64 (20220223) focal InRelease
Hit:2 cdrom://Lubuntu 20.04.4 LTS _Focal Fossa_ - Release amd64 (20220223) focal Release
Hit:4 http://archive.ubuntu.com/ubuntu focal InRelease

Get:6 http://archive.ubuntu.com/ubuntu focal-updates InRelease [114 kB]
Get:7 http://security.ubuntu.com/ubuntu focal-security/main amd64 Packages [1480 kB]
Get:8 http://archive.ubuntu.com/ubuntu focal-updates/main amd64 Packages [1822 kB]
Get:9 http://security.ubuntu.com/ubuntu focal-security/main Translation-en [255 kB]
Get:10 http://security.ubuntu.com/ubuntu focal-security/main amd64 DEP-11 Metadata [40.7 kB]
Get:11 http://security.ubuntu.com/ubuntu focal-security/main DEP-11 48x48 Icons [18.3 kB]
Get:12 http://security.ubuntu.com/ubuntu focal-security/main DEP-11 64x64 Icons [35.5 kB]
```

The terminal window has a standard Linux desktop interface at the bottom, including icons for file manager, terminal, system tools, and system status indicators.

## Step 2: Install Apache

1. To install Apache, run the following command in the terminal:

```
sudo apt-get install apache2
```

```
lubuntu@lubuntu: ~
File Actions Edit View Help
lubuntu@lubuntu: ~
Icons [2497 B]

After this operation, 7504 kB of additional disk space will be used.
Do you want to continue? [Y/n] 
```

Press **y** (yes) and hit **ENTER** to permit the installation.

### Step 3: Install PHP

1. To install PHP, run the following command:

```
$ sudo apt-get install php7.4
```

Press **y** and **ENTER** to allow the installation.

### Step 4: Restart Apache

After the php installation you must restart the Apache service. Enter the command:

```
$ sudo /etc/init.d/apache2 restart
```

### Step 5: Test PHP Processing on Web Server

1. Create a basic **PHP script** and save it to the “web root” directory. This is necessary for Apache to find and serve the file correctly. This directory is located at **/var/www/html/**.

To create a file in that directory, type in the following command:

```
sudo nano /var/www/html/test.php
```

### Step 6: Install mariadb server

1. To install mariadb server, run the following command:

```
$ sudo apt-get install mariadb-server
```

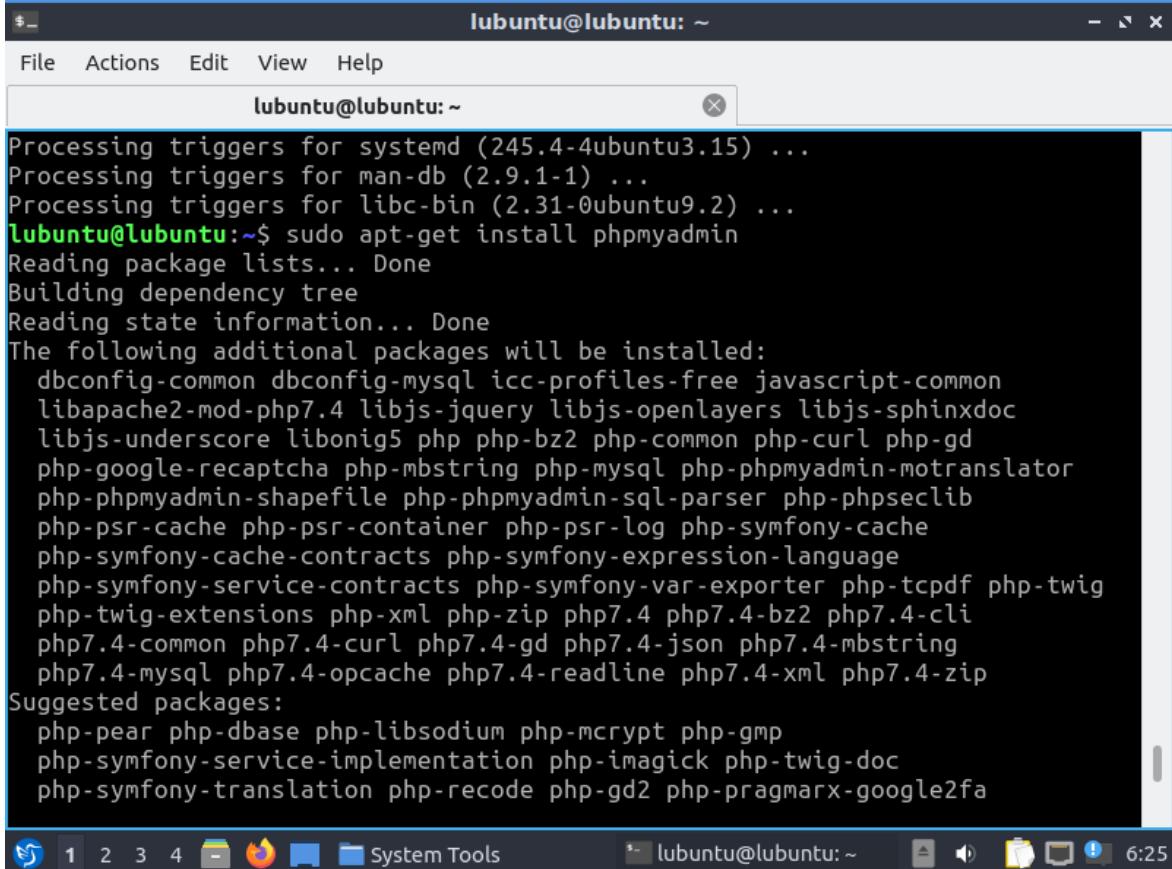

The screenshot shows a Lubuntu desktop environment. A terminal window titled "lubuntu@lubuntu: ~" is open, displaying the output of a command-line session. The user has run the command `sudo apt-get install mariadb-server`. The terminal shows the package manager reading lists, building dependency trees, and listing packages to be installed, including MariaDB components like galera-3, gawk, libcg\*, libdb\*, libsig\*, and mariadb-client-10.3. It also lists suggested packages and NEW packages. The session ends with a confirmation prompt asking if the user wants to continue with "y".

```
lubuntu@lubuntu:~$ sudo apt-get install mariadb-server
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following additional packages will be installed:

mariadb-server-core-10.3 socat
Suggested packages:
gawk-doc libclone-perl libmldb*-perl libnet-daemon-perl
libsql-statement-perl libipc-sharedcache-perl mailx mariadb-test tinyca
The following NEW packages will be installed:
galera-3 gawk libcg*-fast-perl libcg*-pm-perl libconfig-inifiles-perl
libdb*-mysql-perl libdb*-perl libfcgi-perl libhtml-template-perl
libsigsegv2 libterm-readkey-perl mariadb-client-10.3
mariadb-client-core-10.3 mariadb-common mariadb-server
mariadb-server-10.3 mariadb-server-core-10.3 socat
0 upgraded, 18 newly installed, 0 to remove and 169 not upgraded.
Need to get 20.1 MB of archives.
After this operation, 167 MB of additional disk space will be used.
Do you want to continue? [Y/n] y
```

### Step8:Install PHPMyadmin

1. To install PHP Myadmin, run the following command:

```
$ sudo apt-get install phpMyAdmin
```

```
lubuntu@lubuntu: ~
File Actions Edit View Help
lubuntu@lubuntu: ~
Processing triggers for systemd (245.4-4ubuntu3.15) ...

lubuntu@lubuntu: ~
1 2 3 4 System Tools 6:25
```

Press **y** and **ENTER** to allow the installation

1. Then its ask what type of server, we have Apache2 is set by default that's what we want then press  
ok
2. Then a configuration prompt are open . here we're going to just choose yes and then it ask the input  
password for phpmyadmin
3. Then check it correct . go to the localhost/phpmyadmin.  
Here we can not found it so We have to actually edit the file  
php is located in Apache2 folder.
4. Enter the following command to edit the file  
**\$ sudo nano/etc/php7.4/apache2.php.ini**

5. Then we need to uncomment an **extension=mysql.so**. find it  
the file just remove the Semicolon.

6. Then enter **ctl+x** to save

#### Step 9: RestartApache

After the php installation you must restart the Apache service. Enter the command:

**\$ sudo /etc/init.d/apache2 restart**

Step9.1: Include phpMyAdmin in apache configuration

1. Enter the command:

**\$ sudo nano/etc/apache2/apache2.conf**

2. Type the following command to the nano editor

**Include /etc/phpmyadmin/apache.conf**

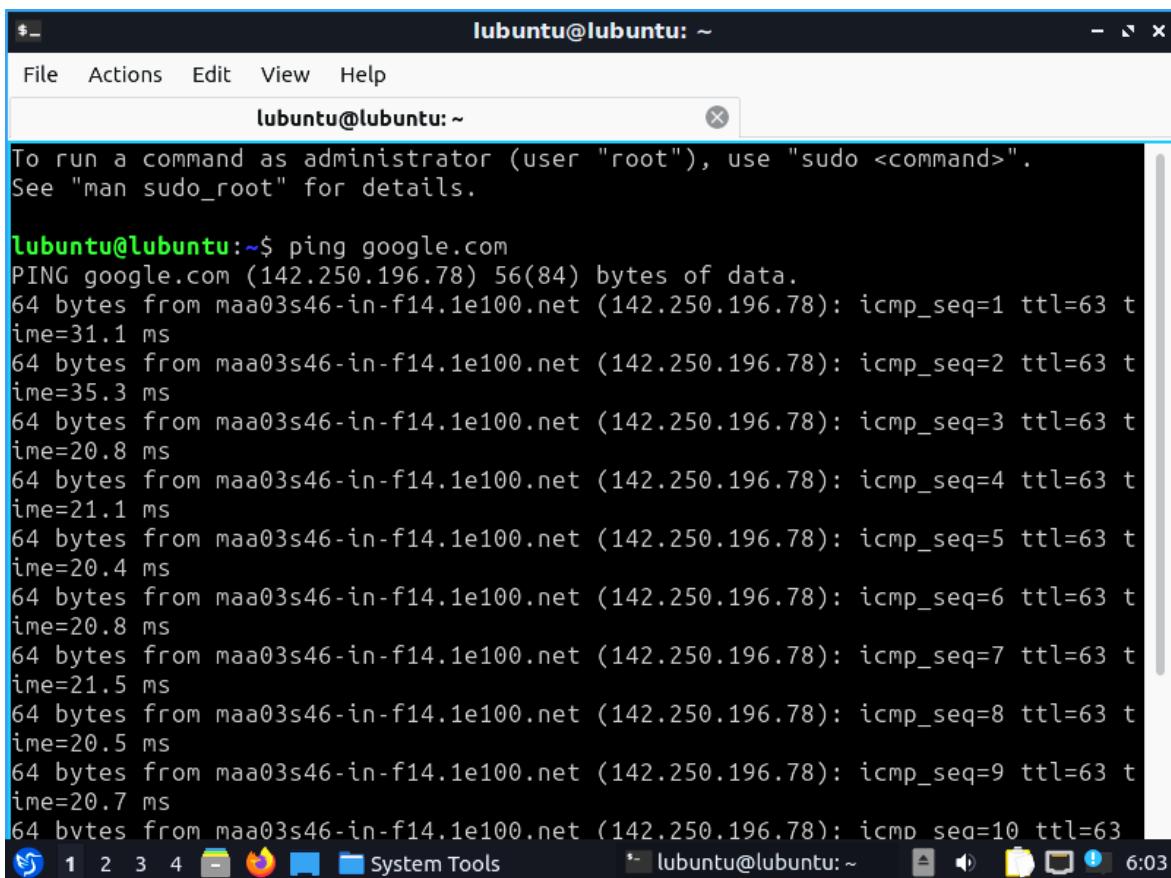

3. Then enter **ctl+x** to save.

4. Then again restart the apache

**EXPERIMENT – 6****NETWORKING COMMANDS****PING COMMAND**

PING (Packet Internet Groper) command is used to check the network connectivity between host and server/host. This command takes as input the IP address or the URL and sends a data packet to the specified address with the message “PING” and get a response from the server/host this time is recorded which is called latency. Fast ping low latency means faster connection. Ping uses ICMP (Internet Control Message Protocol) to send an ICMP echo message to the specified host if that host is available then it sends ICMP reply message. Ping is generally measured in millisecond every modern operating system has this ping pre-installed.

Syntax: ping [OPTIONS] DESTINATION

```

lubuntu@lubuntu:~$ ping google.com
PING google.com (142.250.196.78) 56(84) bytes of data.
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=1 ttl=63 time=31.1 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=2 ttl=63 time=35.3 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=3 ttl=63 time=20.8 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=4 ttl=63 time=21.1 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=5 ttl=63 time=20.4 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=6 ttl=63 time=20.8 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=7 ttl=63 time=21.5 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=8 ttl=63 time=20.5 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=9 ttl=63 time=20.7 ms
64 bytes from maa03s46-in-f14.1e100.net (142.250.196.78): icmp_seq=10 ttl=63

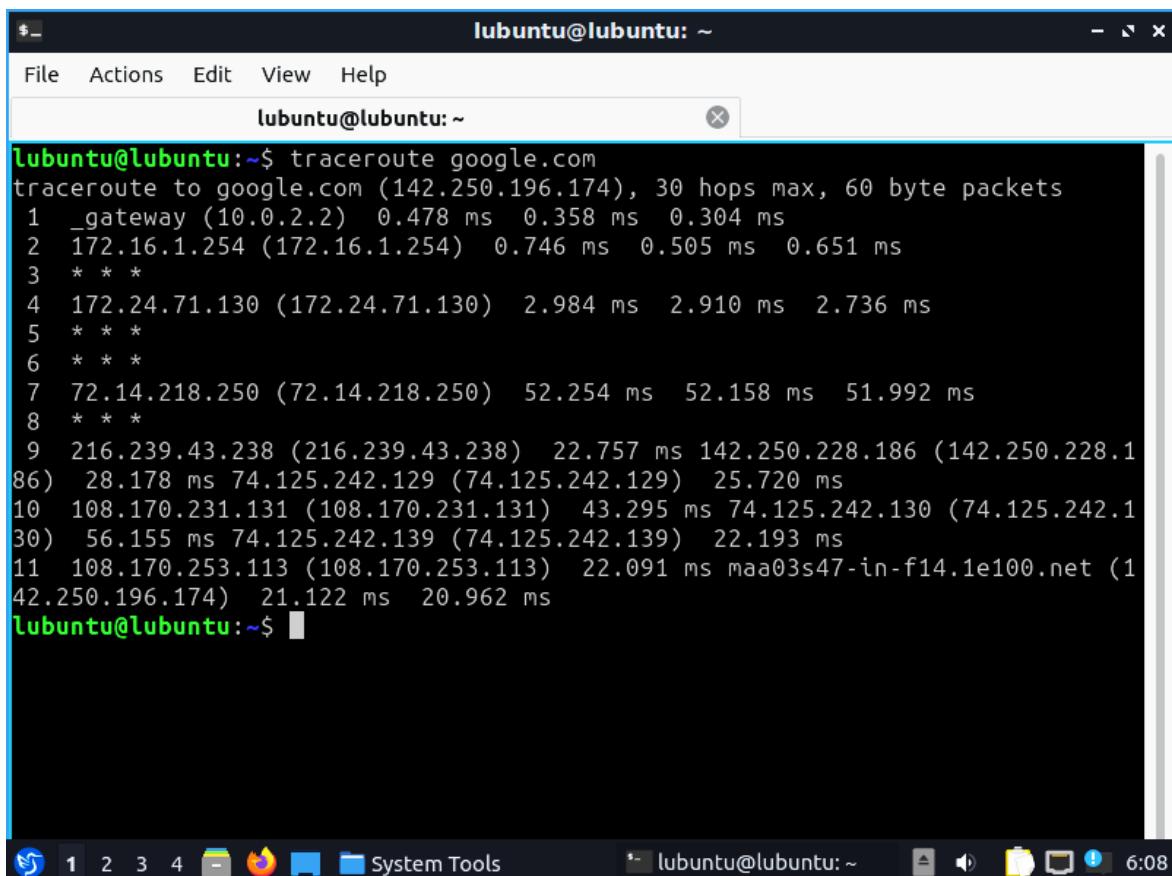

```

The terminal window shows the command `ping google.com` being run. The output displays 10 ICMP echo requests sent to the IP `142.250.196.78`. Each request includes the sequence number, TTL, and round-trip time (time). The window title is `lubuntu@lubuntu:~`. The status bar at the bottom shows the date and time as `6:03`.

## **TRACEROUTE COMMAND**

Traceroute command in Linux prints the route that a packet takes to reach the host. This command is useful when you want to know about the route and about all the hops that a packet takes. Below image depicts how traceroute command is used to reach the Google (172.217.26.206) host from the local machine and it also prints detail about all the hops that it visits in between.

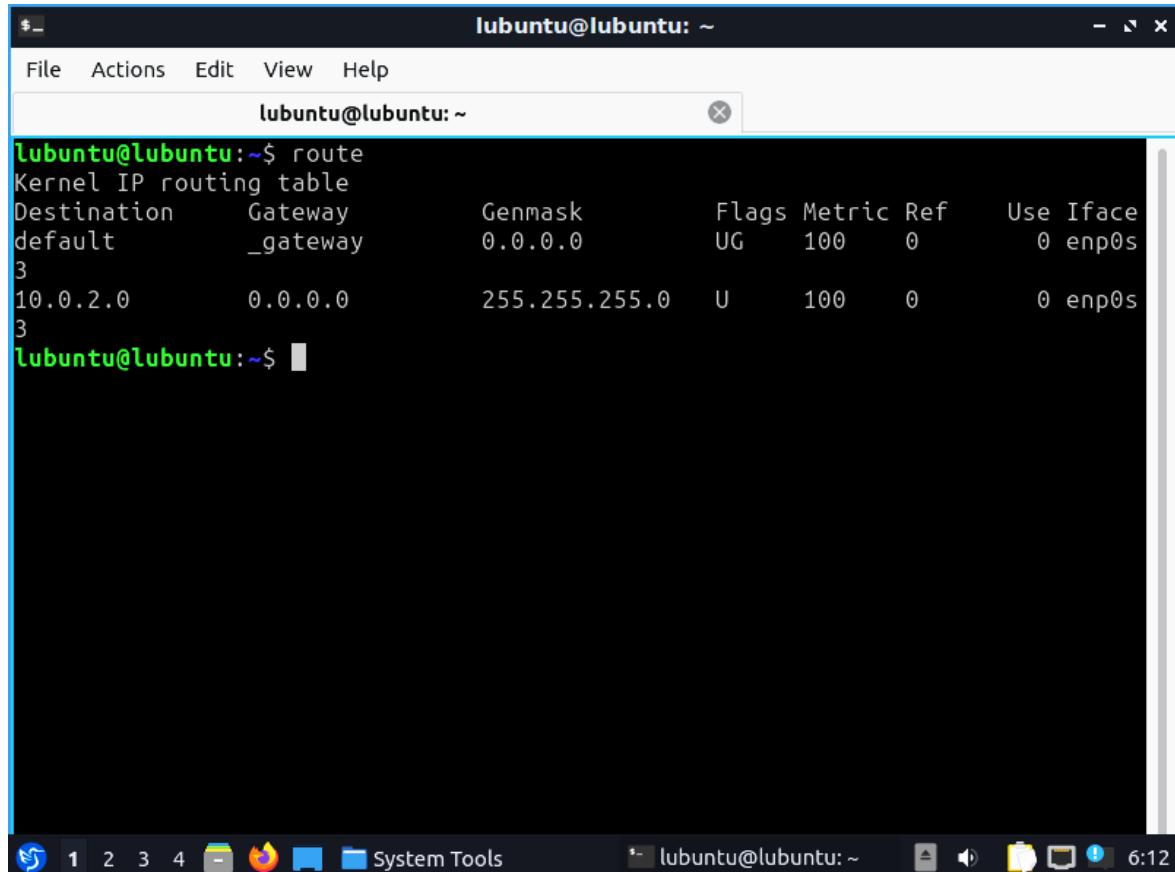

Syntax: traceroute [options] host\_Address [pathlength]

```
lubuntu@lubuntu:~$ traceroute google.com
traceroute to google.com (142.250.196.174), 30 hops max, 60 byte packets
 1 _gateway (10.0.2.2)  0.478 ms  0.358 ms  0.304 ms
 2 172.16.1.254 (172.16.1.254)  0.746 ms  0.505 ms  0.651 ms
 3 * * *
 4 172.24.71.130 (172.24.71.130)  2.984 ms  2.910 ms  2.736 ms
 5 * * *
 6 * * *
 7 72.14.218.250 (72.14.218.250)  52.254 ms  52.158 ms  51.992 ms
 8 * * *
 9 216.239.43.238 (216.239.43.238)  22.757 ms 142.250.228.186 (142.250.228.1
86)  28.178 ms 74.125.242.129 (74.125.242.129)  25.720 ms
10 108.170.231.131 (108.170.231.131)  43.295 ms 74.125.242.130 (74.125.242.1
30)  56.155 ms 74.125.242.139 (74.125.242.139)  22.193 ms
11 108.170.253.113 (108.170.253.113)  22.091 ms maa03s47-in-f14.1e100.net (1
42.250.196.174)  21.122 ms  20.962 ms
lubuntu@lubuntu:~$
```

## **ROUTE COMMAND**

route command in Linux is used when you want to work with the IP/kernel routing table. It is mainly used to set up static routes to specific hosts or networks via an interface. It is used for showing or update the IP/kernel routing table.

The screenshot shows a terminal window titled "lubuntu@lubuntu: ~". The window contains the following text:

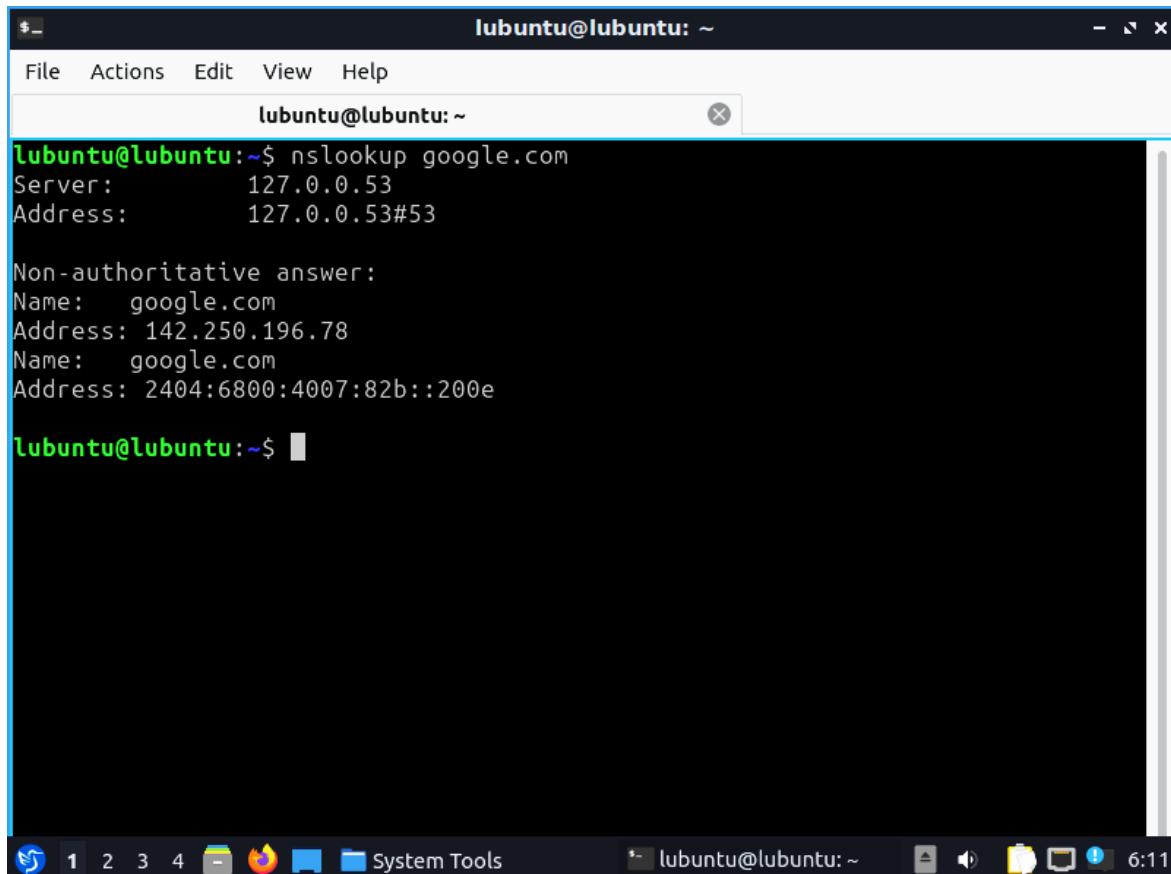

```
lubuntu@lubuntu:~$ route
Kernel IP routing table
Destination      Gateway          Genmask        Flags Metric Ref    Use Iface
default         _gateway        0.0.0.0        UG    100    0        0 enp0s
10.0.2.0        0.0.0.0        255.255.255.0  U      100    0        0 enp0s
3
```

The terminal window has a dark background and light-colored text. The title bar and menu bar are visible at the top. The bottom of the window shows the desktop environment's taskbar with various icons and the system tray.

## **NSLOOKUP COMMAND**

nslookup (stands for “Name Server Lookup”) is a useful command for getting information from DNS server. It is a network administration tool for querying the Domain Name System (DNS) to obtain domain name or IP address mapping or any other specific DNS record. It is also used to troubleshoot DNS related problems.

Syntax: nslookup [option]

The screenshot shows a terminal window titled "lubuntu@lubuntu: ~". The window contains the following text:

```
lubuntu@lubuntu:~$ nslookup google.com
Server:      127.0.0.53
Address:     127.0.0.53#53

Non-authoritative answer:
Name:   google.com
Address: 142.250.196.78
Name:   google.com
Address: 2404:6800:4007:82b::200e

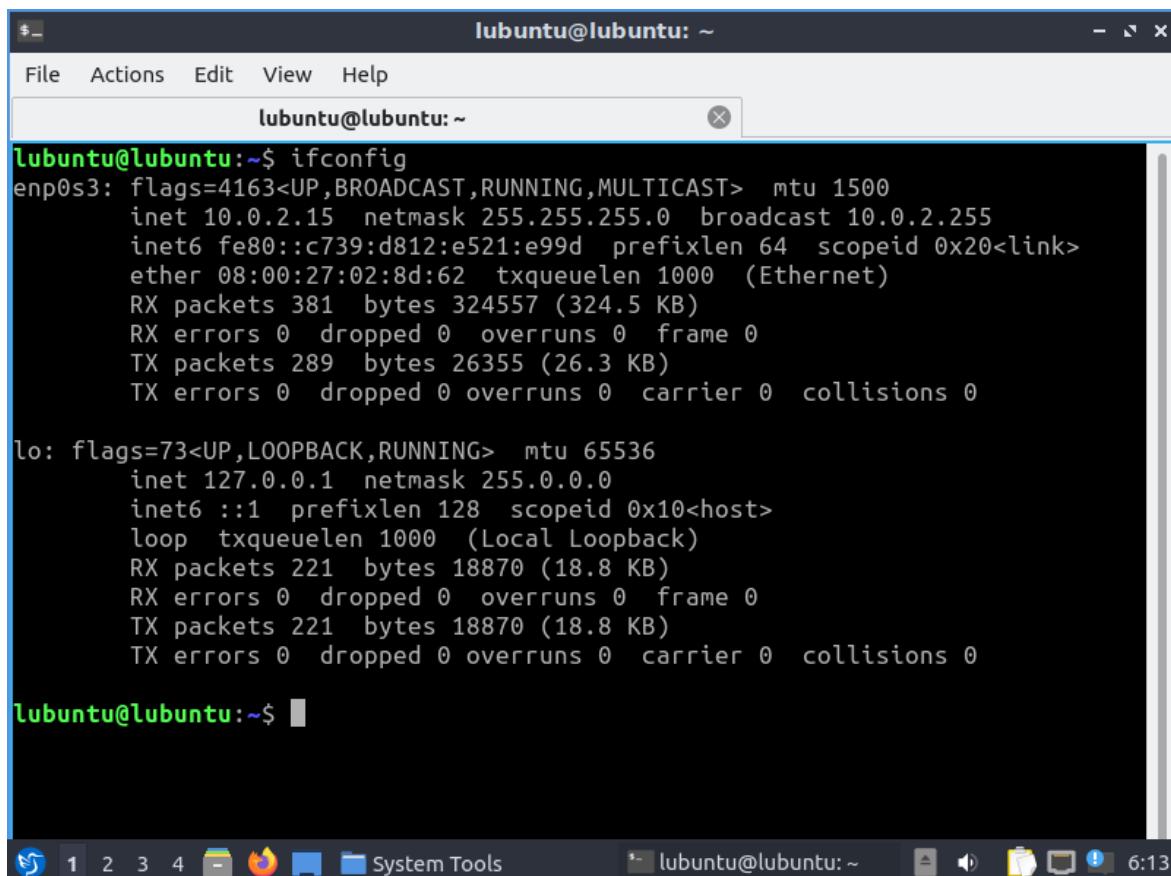

lubuntu@lubuntu:~$
```

The terminal window is part of a desktop environment, with a taskbar at the bottom showing icons for various applications like a web browser, file manager, and system tools. The taskbar also displays the current user and session information: "lubuntu@lubuntu: ~".

## **IFCONFIG COMMAND**

ifconfig(interface configuration) command is used to configure the kernel-resident network interfaces. It is used at the boot time to set up the interfaces as necessary. After that, it is usually used when needed during debugging or when you need system tuning. Also, this command is used to assign the IP address and netmask to an interface or to enable or disable a given interface.

Syntax: ifconfig [...OPTIONS] [INTERFACE]

The screenshot shows a terminal window titled "lubuntu@lubuntu: ~". The window contains the output of the "ifconfig" command. The output shows two network interfaces: "enp0s3" and "lo".

```
lubuntu@lubuntu:~$ ifconfig
enp0s3: flags=4163<UP,BROADCAST,RUNNING,MULTICAST>  mtu 1500
        inet 10.0.2.15  netmask 255.255.255.0  broadcast 10.0.2.255
              inet6 fe80::c739:d812:e521:e99d  prefixlen 64  scopeid 0x20<link>
                ether 08:00:27:02:8d:62  txqueuelen 1000  (Ethernet)
                  RX packets 381  bytes 324557 (324.5 KB)
                  RX errors 0  dropped 0  overruns 0  frame 0
                  TX packets 289  bytes 26355 (26.3 KB)
                  TX errors 0  dropped 0  overruns 0  carrier 0  collisions 0

lo: flags=73<UP,LOOPBACK,RUNNING>  mtu 65536
        inet 127.0.0.1  netmask 255.0.0.0
              inet6 ::1  prefixlen 128  scopeid 0x10<host>
                loop  txqueuelen 1000  (Local Loopback)
                  RX packets 221  bytes 18870 (18.8 KB)
                  RX errors 0  dropped 0  overruns 0  frame 0
                  TX packets 221  bytes 18870 (18.8 KB)
                  TX errors 0  dropped 0  overruns 0  carrier 0  collisions 0

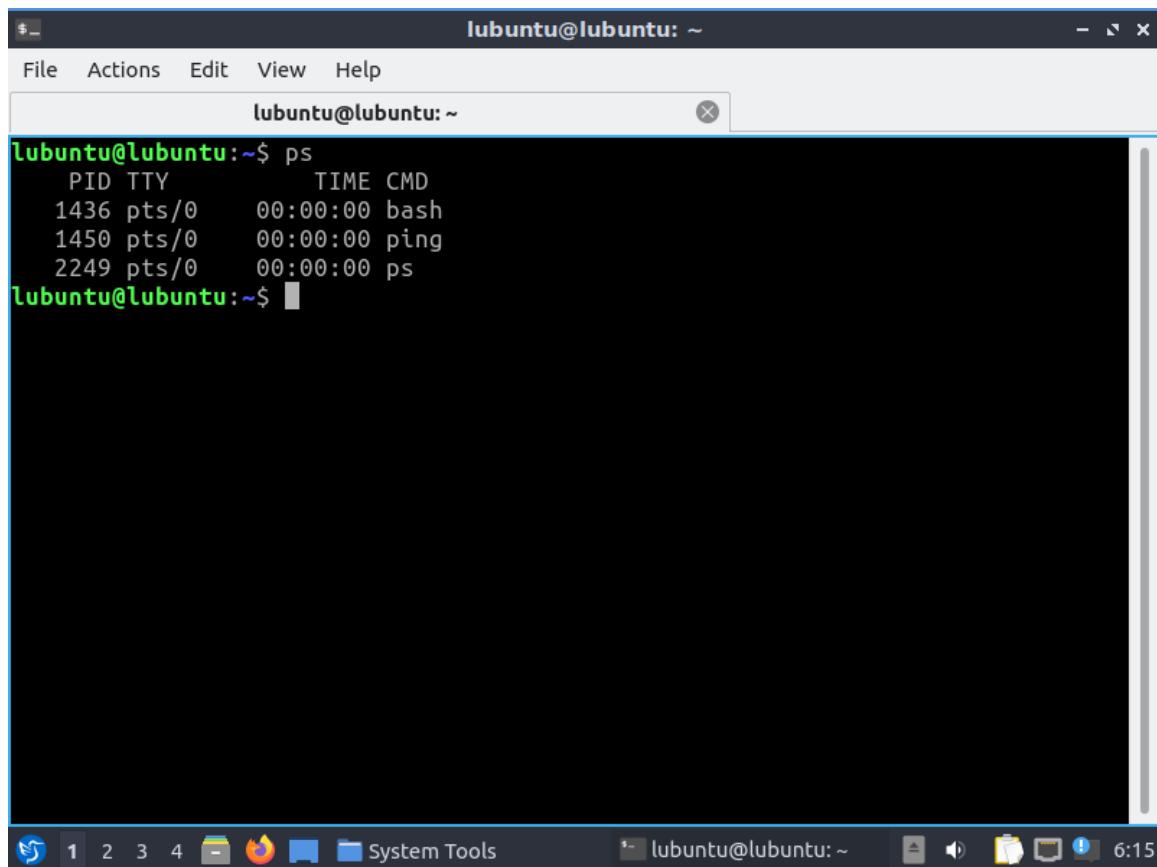

lubuntu@lubuntu:~$
```

## **PS COMMAND**

Linux provides us a utility called ps for viewing information related with the processes on a system which stands as abbreviation for “Process Status”. ps command is used to list the currently running processes and their PIDs along with some other information depends on different options. It reads the process information from the virtual files in /proc file-system. /proc contains virtual files, this is the reason it's referred as a virtual file system.

ps provides numerous options for manipulating the output according to our need.

Syntax: ps [options]

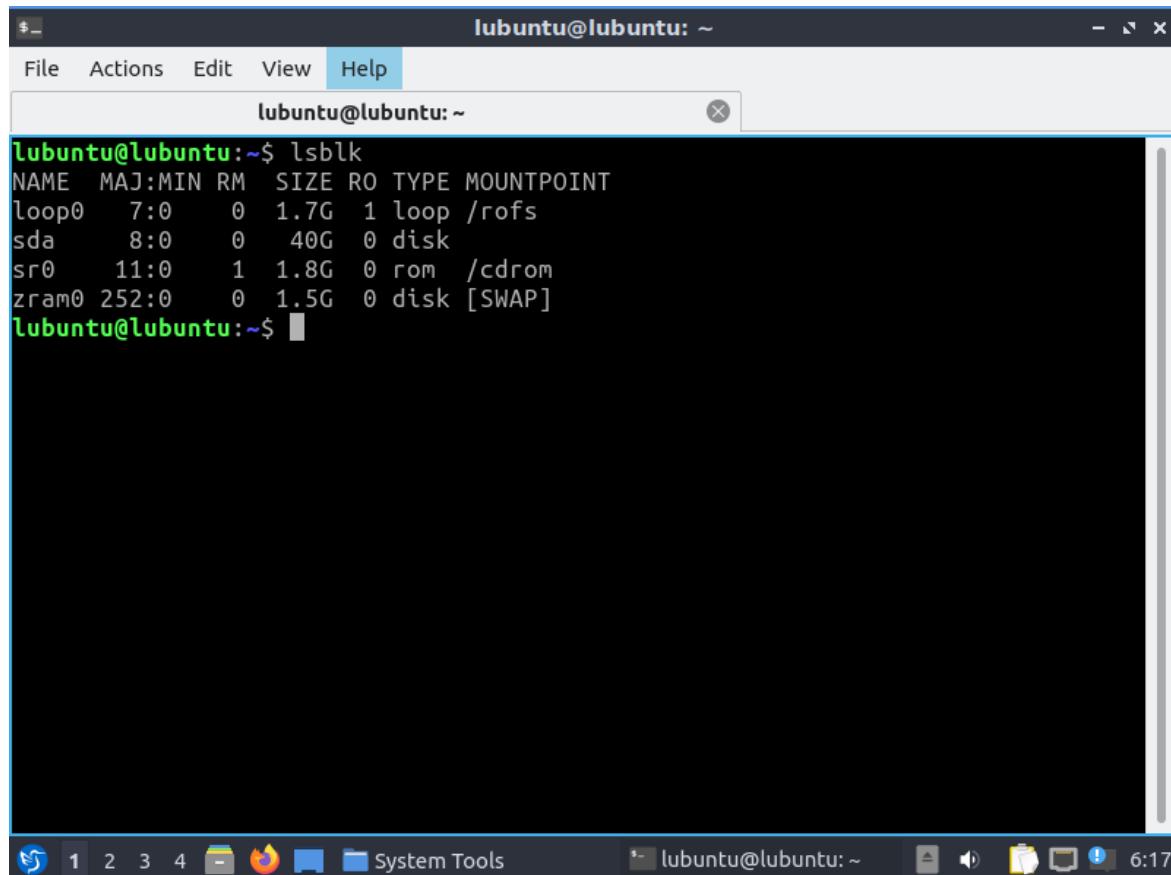

The screenshot shows a terminal window titled "lubuntu@lubuntu: ~". The window has a menu bar with "File", "Actions", "Edit", "View", and "Help". Below the menu is a toolbar with icons for "File", "Actions", "Edit", "View", and "Help". The main area of the terminal displays the following output of the ps command:

```
lubuntu@lubuntu:~$ ps
  PID TTY      TIME CMD
 1436 pts/0    00:00:00 bash
 1450 pts/0    00:00:00 ping
 2249 pts/0    00:00:00 ps
lubuntu@lubuntu:~$
```

The terminal window is set against a desktop background with a blue vertical scroll bar on the right. The desktop taskbar at the bottom shows several icons: a clock, a terminal icon with the number 1, a file icon with the number 2, a folder icon with the number 3, a Firefox icon with the number 4, a blue square icon, a System Tools icon, and a volume control icon. The system tray on the right side of the taskbar shows icons for battery status, signal strength, and a clock displaying 6:15.

## **LUBLK COMMAND**

Lsblk is used to display details about block devices and these block devices (Except ram disk) are basically those files that represent devices connected to the pc. It queries /sys virtual file system and udev db to obtain information that it displays. And it basically displays output in a tree-like structure. This command comes pre-installed with the util-Linux package.

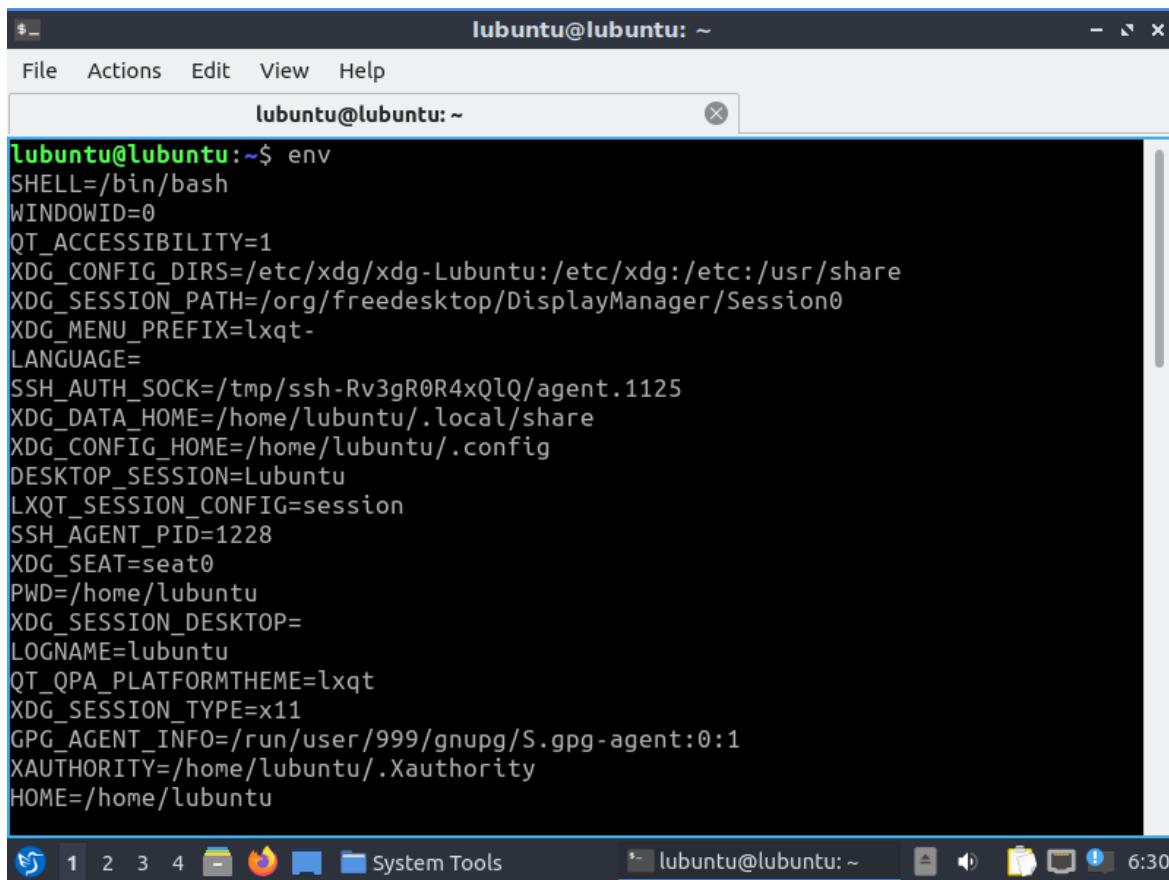

The screenshot shows a terminal window titled "lubuntu@lubuntu: ~". The window contains the following text:

```
lubuntu@lubuntu:~$ lsblk
NAME  MAJ:MIN RM  SIZE RO TYPE MOUNTPOINT
loop0  7:0    0  1.7G  1 loop /rofs
sda   8:0    0  40G  0 disk 
sr0   11:0   1  1.8G  0 rom  /cdrom
zram0 252:0  0  1.5G  0 disk [SWAP]
lubuntu@lubuntu:~$
```

The terminal window has a dark background and light-colored text. The title bar and some menu items are visible at the top. The bottom of the window shows the desktop environment's taskbar with icons for various applications like a browser and system tools.

## **ENV COMMAND**

env-env is a shell command for Unix and Unix-like operating systems. It is used to either print a list of environment variables or run another utility in an altered environment without having to modify the currently existing environment. Using env, variables may be added or removed, and existing variables may be changed by assigning new values to them. In practice, env has another common use. It is often used by shell scripts to launch the correct interpreter. In this usage, the environment is typically not changed. If env is run without any options, it prints the variables of the current environment. Otherwise, env sets each NAME to VALUE and executes COMMAND.

The screenshot shows a terminal window titled "lubuntu@lubuntu: ~". The window contains the output of the "env" command, listing numerous environment variables. The variables include SHELL=/bin/bash, WINDOWID=0, QT\_ACCESSIBILITY=1, XDG\_CONFIG\_DIRS=/etc/xdg/xdg-Lubuntu:/etc/xdg:/etc/share, XDG\_SESSION\_PATH=/org/freedesktop/DisplayManager/Session0, XDG\_MENU\_PREFIX=lxqt-, LANGUAGE=, SSH\_AUTH\_SOCK=/tmp/ssh-Rv3gR0R4xQlQ/agent.1125, XDG\_DATA\_HOME=/home/lubuntu/.local/share, XDG\_CONFIG\_HOME=/home/lubuntu/.config, DESKTOP\_SESSION=Lubuntu, LXQT\_SESSION\_CONFIG=session, SSH\_AGENT\_PID=1228, XDG\_SEAT=seat0, PWD=/home/lubuntu, XDG\_SESSION\_DESKTOP=, LOGNAME=lubuntu, QT\_QPA\_PLATFORMTHEME=lxqt, XDG\_SESSION\_TYPE=x11, GPG\_AGENT\_INFO=/run/user/999/gnupg/S.gpg-agent:0:1, XAUTHORITY=/home/lubuntu/.Xauthority, HOME=/home/lubuntu. The terminal window has a standard Linux desktop interface at the bottom, showing icons for various applications like a web browser, file manager, and system tools.

```
lubuntu@lubuntu:~$ env
SHELL=/bin/bash
WINDOWID=0
QT_ACCESSIBILITY=1
XDG_CONFIG_DIRS=/etc/xdg/xdg-Lubuntu:/etc/xdg:/etc/share
XDG_SESSION_PATH=/org/freedesktop/DisplayManager/Session0
XDG_MENU_PREFIX=lxqt-
LANGUAGE=
SSH_AUTH_SOCK=/tmp/ssh-Rv3gR0R4xQlQ/agent.1125
XDG_DATA_HOME=/home/lubuntu/.local/share
XDG_CONFIG_HOME=/home/lubuntu/.config
DESKTOP_SESSION=Lubuntu
LXQT_SESSION_CONFIG=session
SSH_AGENT_PID=1228
XDG_SEAT=seat0
PWD=/home/lubuntu
XDG_SESSION_DESKTOP=
LOGNAME=lubuntu
QT_QPA_PLATFORMTHEME=lxqt
XDG_SESSION_TYPE=x11
GPG_AGENT_INFO=/run/user/999/gnupg/S.gpg-agent:0:1
XAUTHORITY=/home/lubuntu/.Xauthority
HOME=/home/lubuntu
```

## **ECHO COMMAND**

To get the current user name, shell, path, home.

```
lubuntu@lubuntu: ~
File Actions Edit View Help
lubuntu@lubuntu: ~
lubuntu@lubuntu:~$ echo $SHELL
/bin/bash
lubuntu@lubuntu:~$
```

```
lubuntu@lubuntu: ~
File Actions Edit View Help
lubuntu@lubuntu: ~
lubuntu@lubuntu:~$ echo $USER
lubuntu
lubuntu@lubuntu:~$
```

```
lubuntu@lubuntu: ~
File Actions Edit View Help
lubuntu@lubuntu: ~
lubuntu@lubuntu:~$ echo $HOME
/home/lubuntu
lubuntu@lubuntu:~$
```

```
lubuntu@lubuntu: ~
File Actions Edit View Help
lubuntu@lubuntu: ~
lubuntu@lubuntu:~$ echo $PATH
/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/games:/usr/local/games:/snap/bin
lubuntu@lubuntu:~$
```

## **PS1 AND PS2 COMMANDS**

The BASH prompt contains four different values: PS1, PS2, PS3, and PS4. The PS stands for Prompt Statement.

PS1 – This is the primary prompt display. This is where you set special characters or important information.

PS2 – This is the secondary prompt string. This is usually set as a divider between the prompt display and the text entry. It is also used to display when a long command is broken into sections with the \ sign.

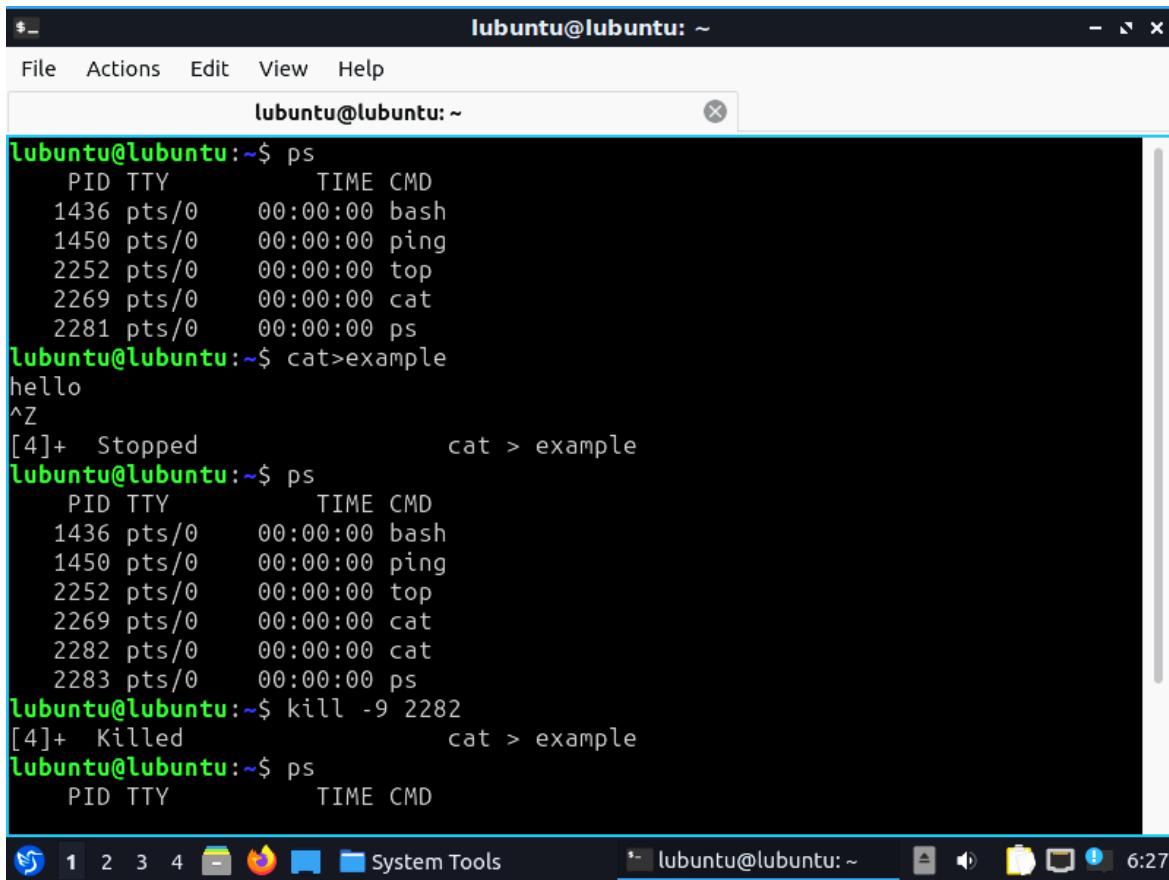

You can change the BASH prompt temporarily by using the ps1 command.

The image consists of three vertically stacked screenshots of a terminal window titled "lubuntu@lubuntu: ~". Each screenshot shows a different state of the PS1 variable:

- Screenshot 1 (Top):** Shows the command "lubuntu@lubuntu:~\$ PS1='HELLO'" followed by six "HELLO" outputs. The terminal window has a dark background and light-colored text.
- Screenshot 2 (Middle):** Shows the same command and output as the first screenshot, but the terminal window has a light background and dark-colored text.
- Screenshot 3 (Bottom):** Shows the command "lubuntu@lubuntu:~\$ PS2='@'" followed by seven "@" outputs. The terminal window has a light background and dark-colored text.

## **KILL COMMAND**

The kill command is used to terminate (kill) a process in Linux. If a program becomes totally unresponsive, you might be forced to terminate it using this command. The kill command sends signals to running processes (identified by their PIDs) in order to request the termination of the process. Besides telling a process to end, signals can tell a process to reread configuration files, pause, continue if stopped, etc. Signals are represented using different numbers. If you don't specify the signal, the default value is 15, which causes the process to exit but allow it to close open files.

A screenshot of a terminal window titled "lubuntu@lubuntu: ~". The window contains the following session:

```
lubuntu@lubuntu:~$ ps
  PID TTY      TIME CMD
 1436 pts/0    00:00:00 bash
 1450 pts/0    00:00:00 ping
 2252 pts/0    00:00:00 top
 2269 pts/0    00:00:00 cat
 2281 pts/0    00:00:00 ps
lubuntu@lubuntu:~$ cat>example
hello
^Z
[4]+  Stopped                  cat > example
lubuntu@lubuntu:~$ ps
  PID TTY      TIME CMD
 1436 pts/0    00:00:00 bash
 1450 pts/0    00:00:00 ping
 2252 pts/0    00:00:00 top
 2269 pts/0    00:00:00 cat
 2282 pts/0    00:00:00 cat
 2283 pts/0    00:00:00 ps
lubuntu@lubuntu:~$ kill -9 2282
[4]+  Killed                  cat > example
lubuntu@lubuntu:~$ ps
  PID TTY      TIME CMD
```

The terminal window has a black background with white text. It includes a menu bar with File, Actions, Edit, View, Help, and a title bar with the user's name and the terminal prompt. The bottom of the window shows the desktop environment's taskbar with icons for the terminal, file manager, browser, and system tools, along with a clock showing 6:27.

The screenshot shows a terminal window titled "lubuntu@lubuntu: ~" running on a Lubuntu desktop environment. The window displays the output of the "top" command, which provides a real-time view of system activity.

System statistics from "top" command:

```
top - 06:16:42 up 20 min,  1 user,  load average: 0.00, 0.02, 0.04
Tasks: 139 total,   1 running, 137 sleeping,   1 stopped,   0 zombie
%Cpu(s):  1.0 us,  1.0 sy,  0.0 ni, 98.0 id,  0.0 wa,  0.0 hi,  0.0 si,  0.0
MiB Mem : 2983.0 total,   174.3 free,   322.3 used, 2486.4 buff/cache
MiB Swap: 1491.5 total,   1490.5 free,      1.0 used. 2386.9 avail Mem
```

Process list from "top" command:

PID	USER	PR	NI	VIRT	RES	SHR	S	%CPU	%MEM	TIME+
989	root	20	0	251132	68332	44508	S	1.0	2.2	0:04.35

4	root	0	-20	0	0	0	I	0.0	0.0	0:00.00
5	root	20	0	0	0	0	I	0.0	0.0	0:00.00
6	root	0	-20	0	0	0	I	0.0	0.0	0:00.00
8	root	20	0	0	0	0	I	0.0	0.0	0:00.10
9	root	0	-20	0	0	0	I	0.0	0.0	0:00.00
10	root	20	0	0	0	0	S	0.0	0.0	0:00.00
11	root	20	0	0	0	0	S	0.0	0.0	0:00.00
12	root	20	0	0	0	0	S	0.0	0.0	0:00.12
13	root	20	0	0	0	0	I	0.0	0.0	0:00.17
14	root	rt	0	0	0	0	S	0.0	0.0	0:00.01

The terminal window also includes a menu bar with "File", "Actions", "Edit", "View", and "Help". Below the menu is a toolbar with icons for file operations and system tools. The status bar at the bottom shows the current user ("lubuntu@lubuntu: ~"), the date and time ("6:16"), and system icons.

## **EXPERIMENT – 7**

### **INDRODUCTION TO VIRTUAL MACHINES**

#### ***Creating a Virtual Machine***

##### **1. Install VirtualBox .**

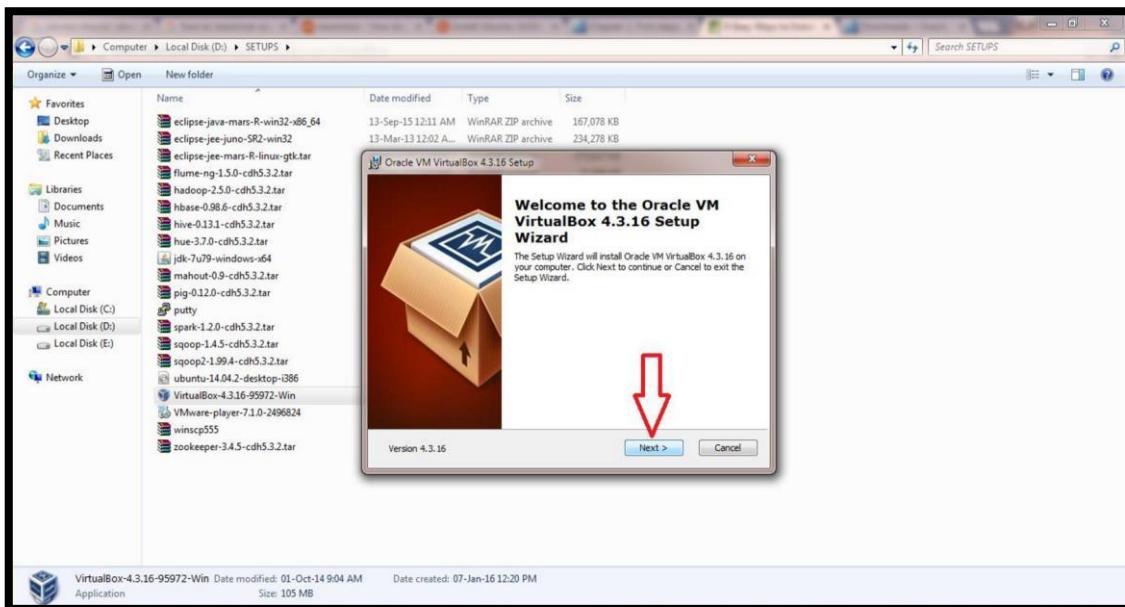

If you don't already have VirtualBox installed on your Windows or Mac computer, you'll need to install it before proceeding.

**Following are the steps required to install VirtualBox(Oracle VM VirtualBox):**

You can download the latest version of VirtualBox from the Virtual Box website:

**<https://www.virtualbox.org/wiki/Downloads>** according to the version of your operating system Windows, Mac or Linux.

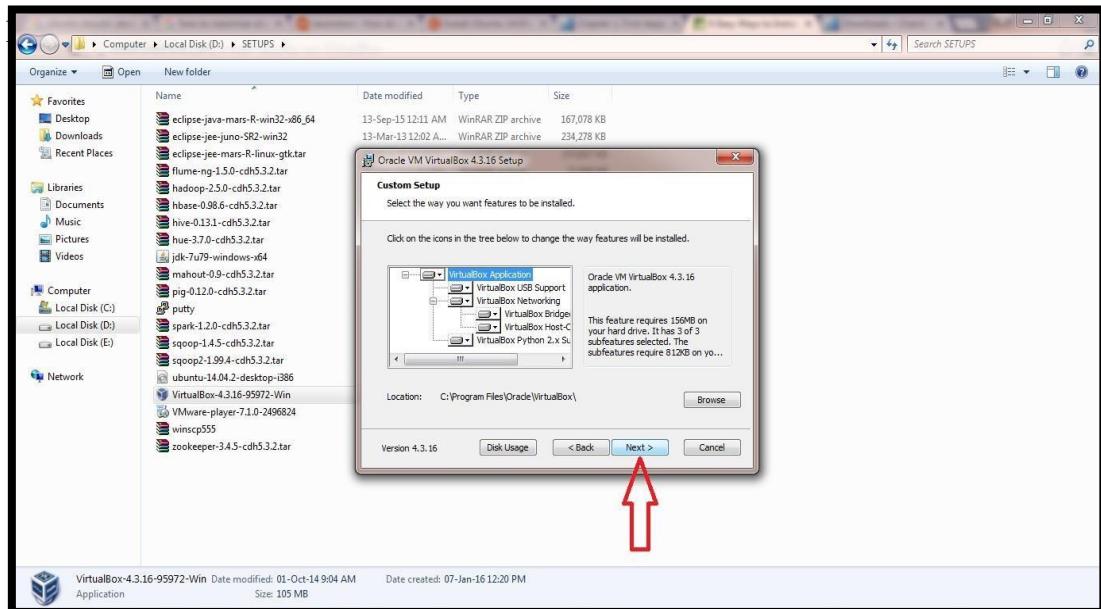

##### **1.1. Click Next**

To Install VirtualBox – Setup Wizard

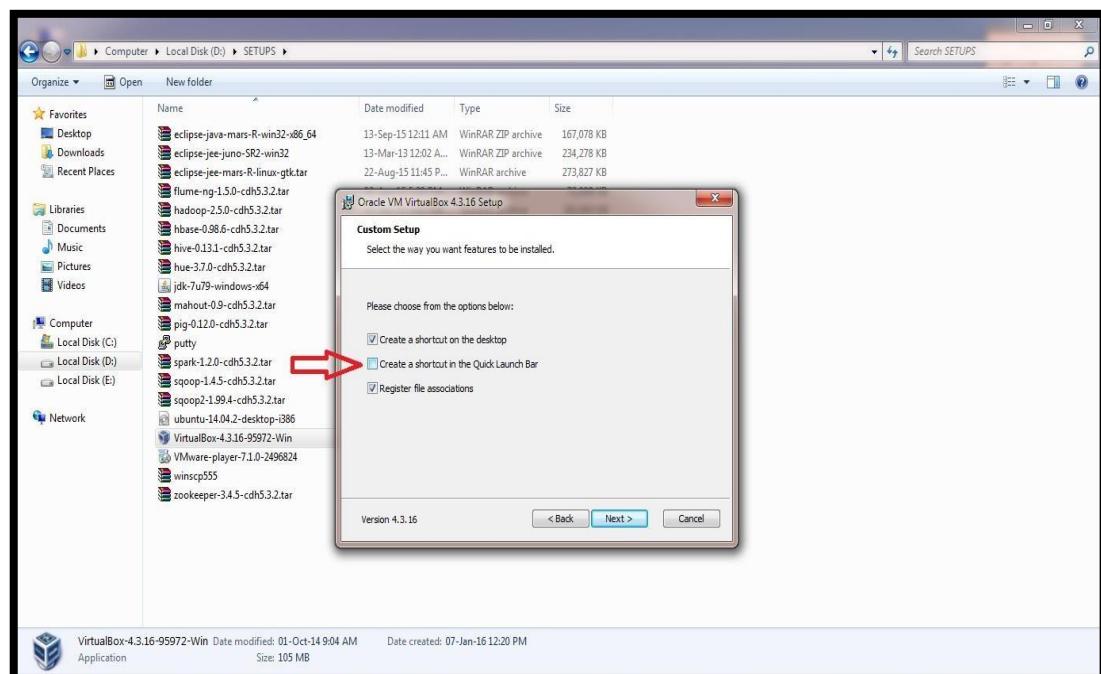

## 1.2. Click Next

To

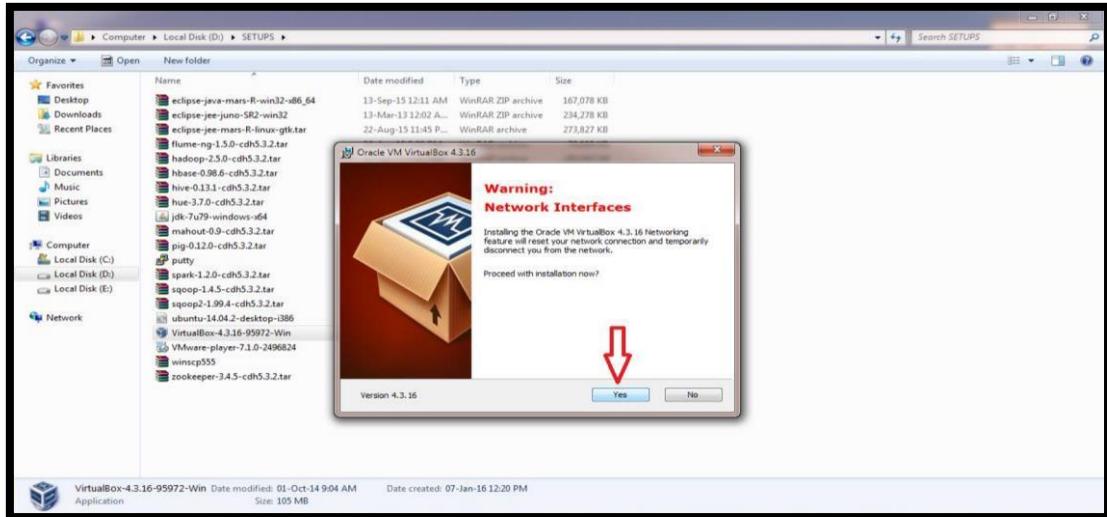

To Install VirtualBox – Custom Setup

## 1.3. Uncheck “Create a shortcut in the Quick Launch Bar” and click “Next”

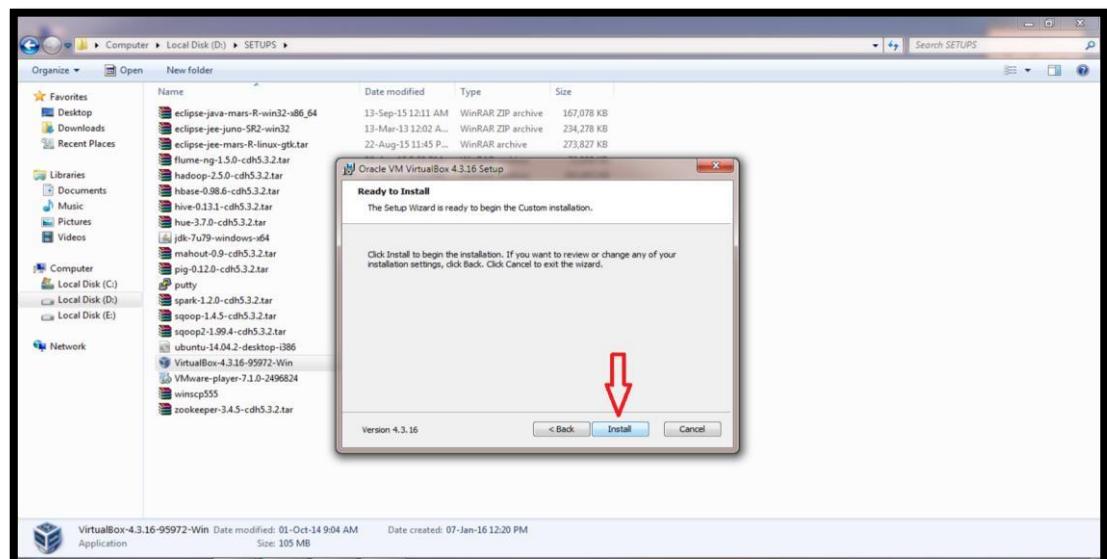

To Install VirtualBox – Features Selection

**1.4. Click “Yes”**

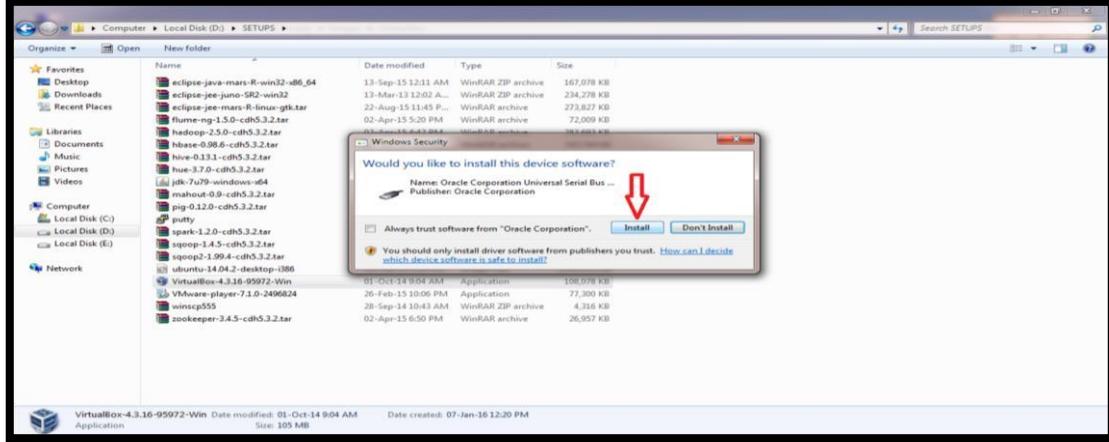

To Install VirtualBox – Network Interfaces Warning

**1.5. Click “Install”**

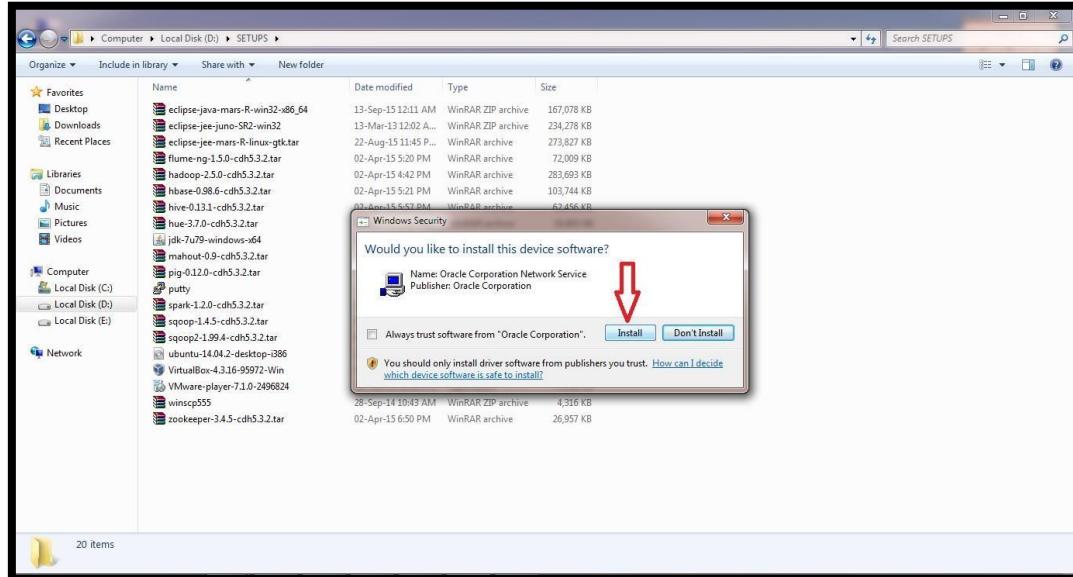

Installation of Oracle VM VirtualBox – Ready to Install

### 1.6. Click “Install”

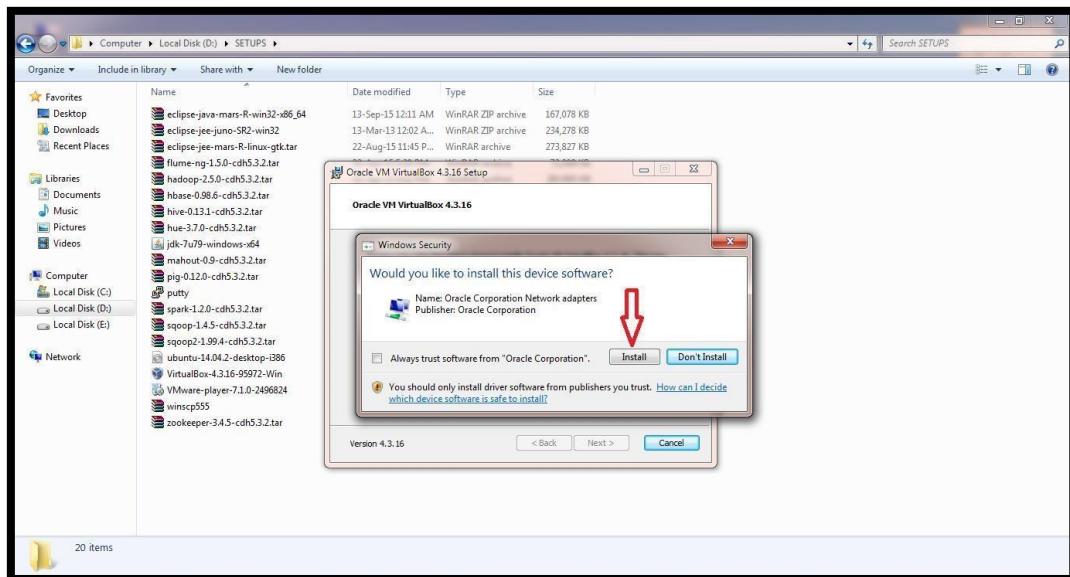

### Installation of Oracle VM VirtualBox- Serial Bus Software Installation

#### 1.7. Click “Install”

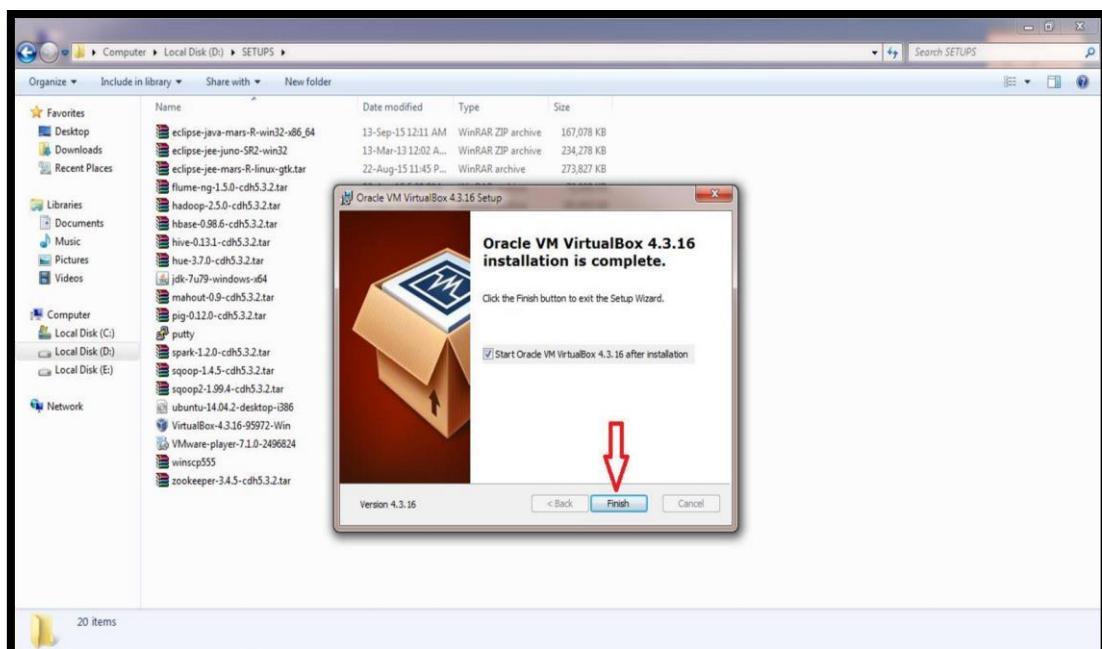

### Installation of Oracle VM VirtualBox – Network Service Installation

**1.8. Click “Install”**

Installation of Oracle VM VirtualBox – Network Adapters Installation

**1.9. Click “Finish”**

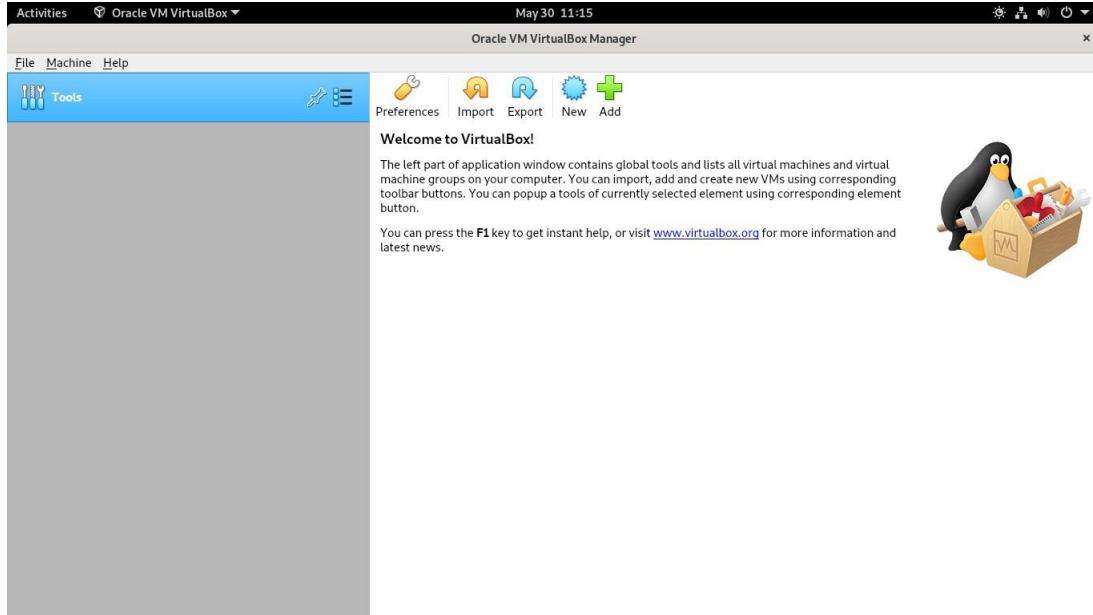

**2. Open VirtualBox.**

Double-click (or click once on a Mac) the VirtualBox app icon.

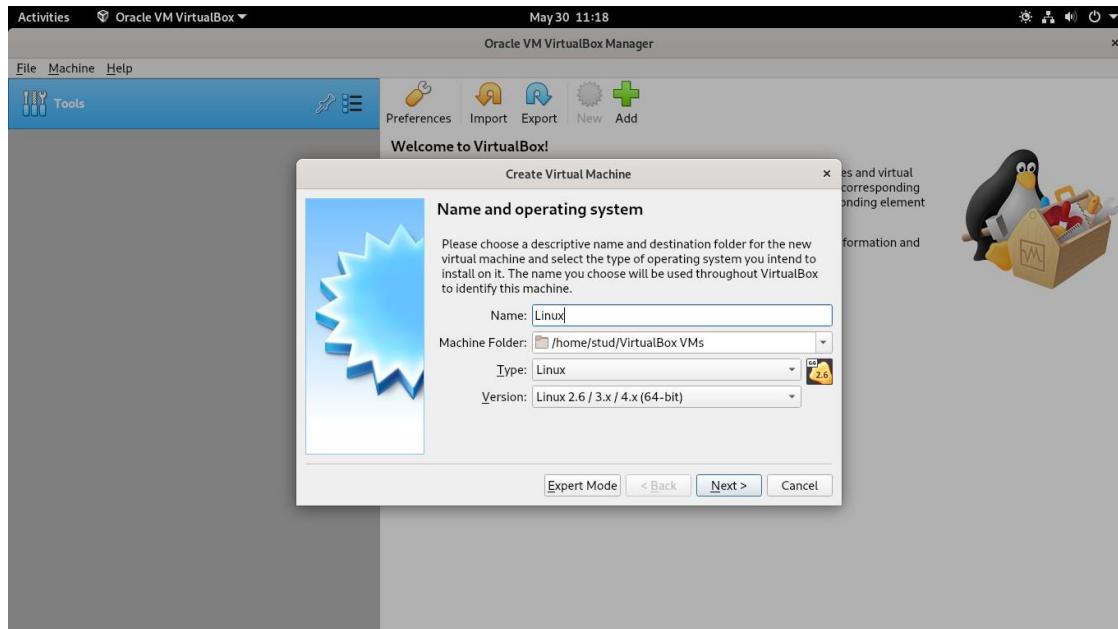

### 3. Click New.

It's a blue badge in the upper-left corner of the VirtualBox window. Doing so opens a pop-up menu.

### 4. Enter a name for your virtual machine.

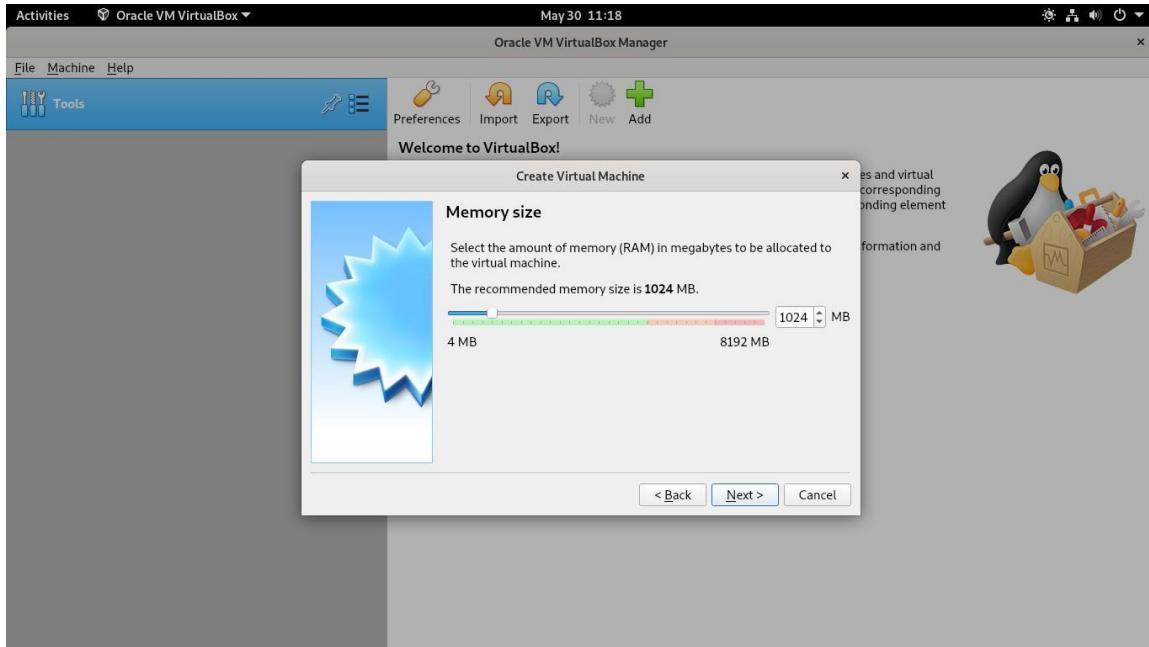

Type whatever you want to name your virtual machine (e.g., Ubuntu) into the "Name" text field that's near the top of the pop-up menu.

For Operating System Type, select the OS that you want to install. Select the version of the operating system. **Click Next.** It's at the bottom of the menu.

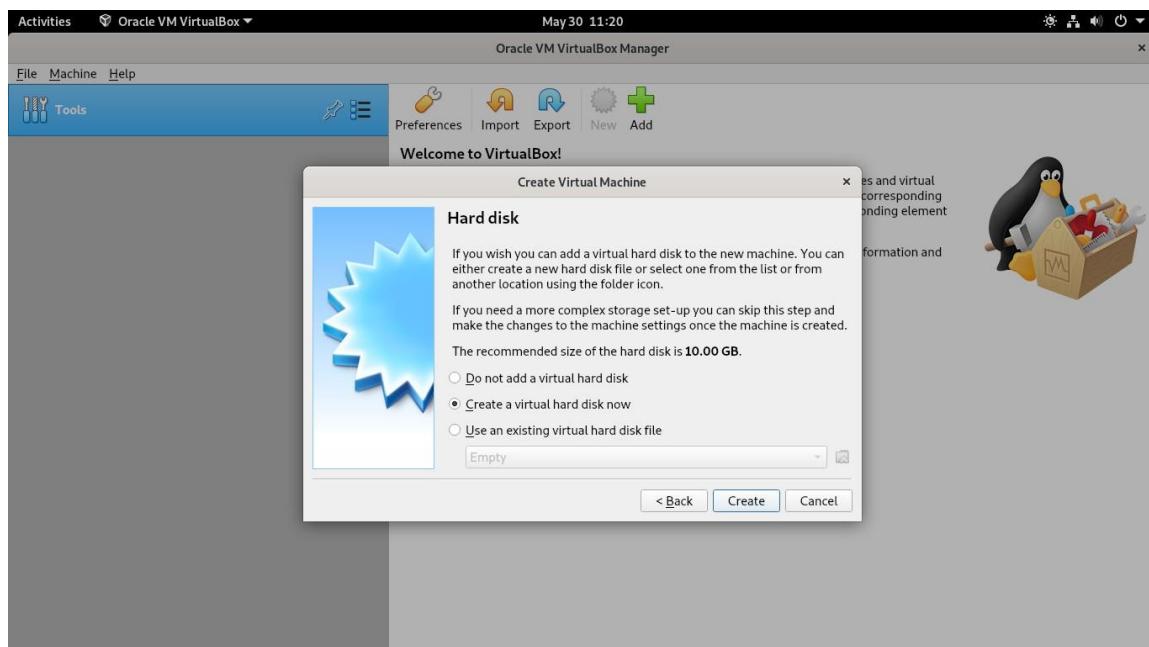

**5.** Select an amount of RAM to use. Click and drag the slider left or right to decrease or increase the amount of RAM that VirtualBox will have available for your virtual machine.

The ideal amount of RAM will automatically be selected when you get to this page. Make sure not to increase the RAM into the red section of the slider; try to keep the slider in the green.

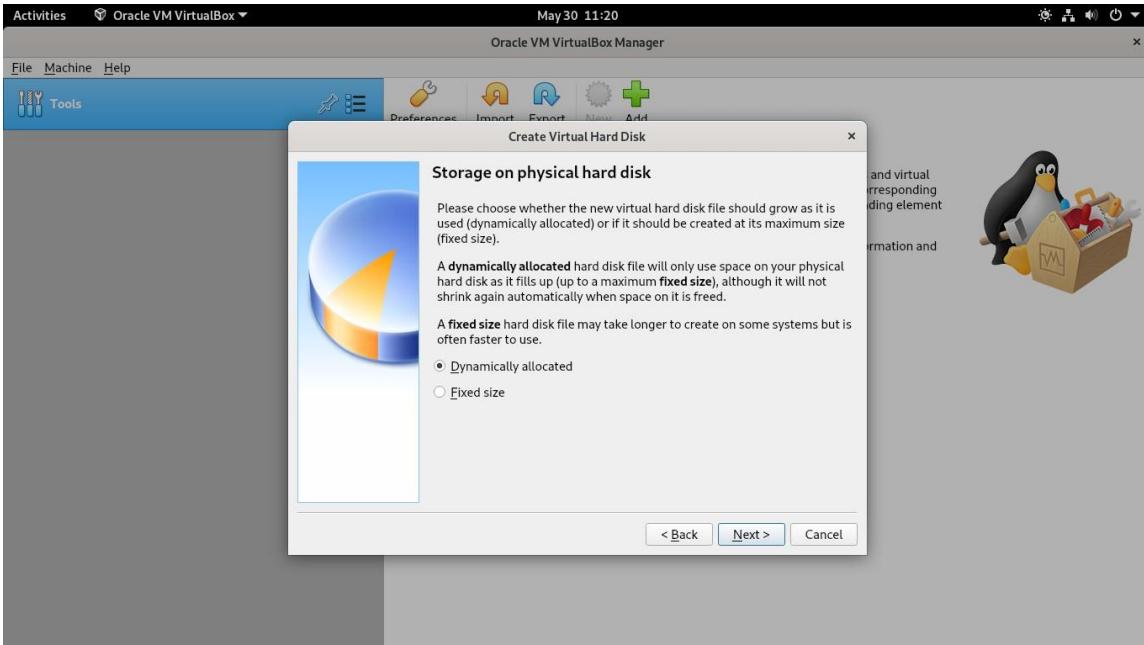

**Click Next.** It's at the bottom of the menu.

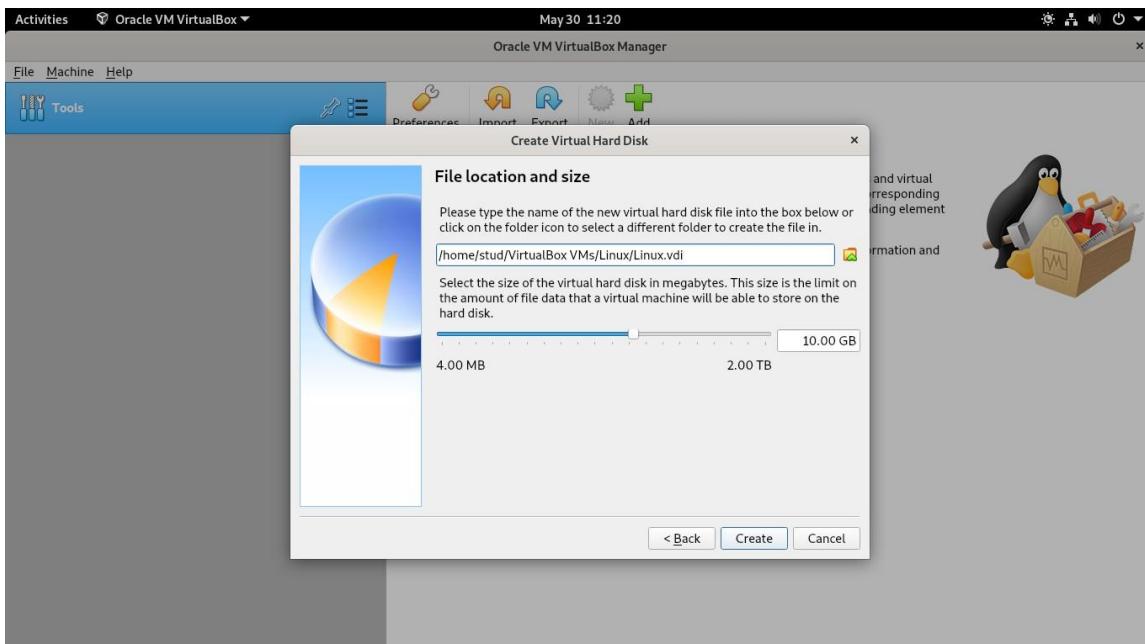

**6.** Create your virtual machine's virtual hard drive. The virtual hard drive is a section of your computer's hard drive space which will be used to store your virtual machine's files and programs:

**7. Use “VDI” to create a virtual hard disk. Choose “Dynamically allocated.”**

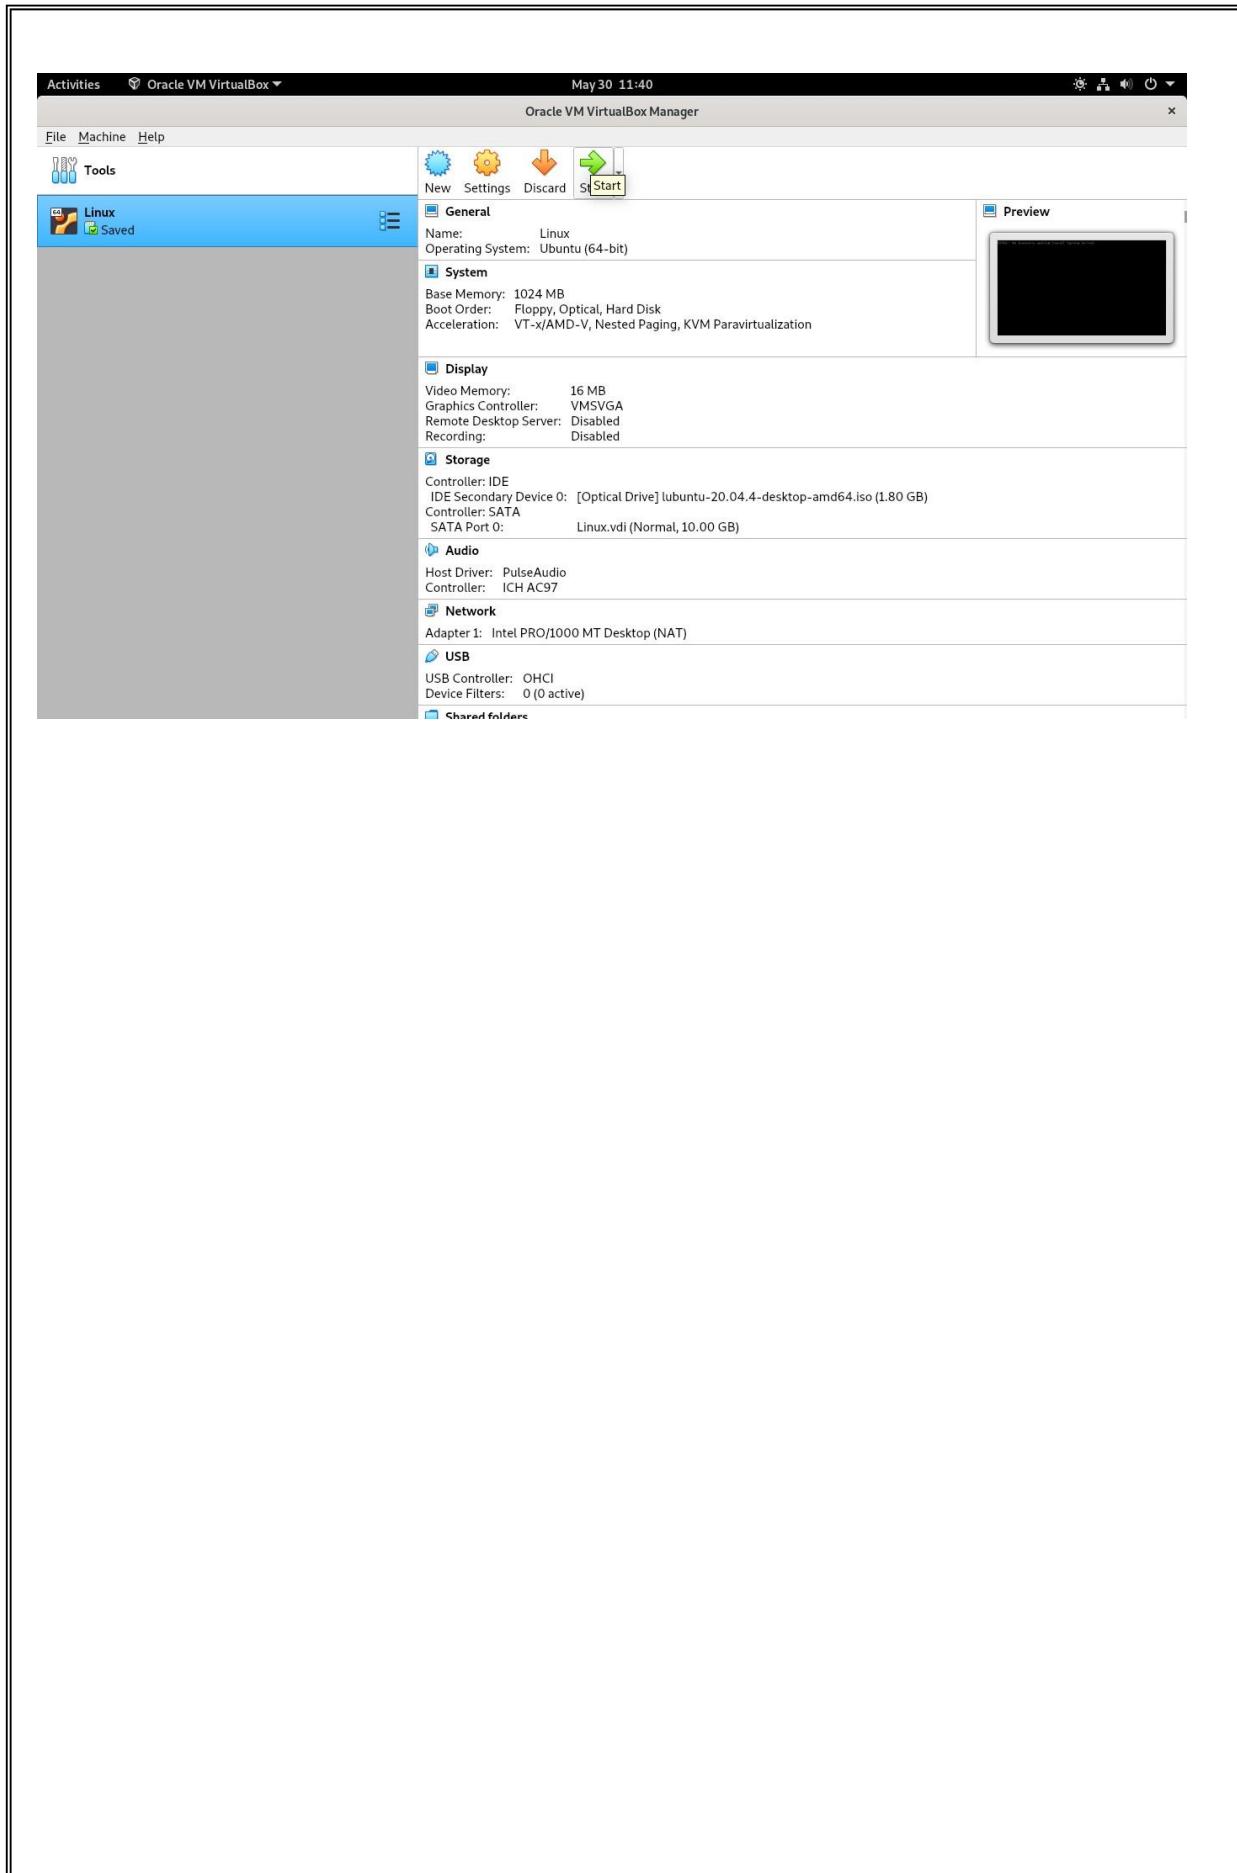

**8. Allocate at Minimum 8 GB (recommended 10 or more).**

Click Create, to create your new virtual machine. The virtual machine is displayed in the list on the left side of the VirtualBox Manager window, with the name that you entered initially.

VMs can run multiple operating system environments on a single physical computer, saving physical space, time and management costs

## **EXPERIMENT No – 8**

### **WIRESHARK**

Wireshark is an open-source packet analyzer, which is used for education, analysis, software development, communication protocol development, and network troubleshooting. It is used to track the packets so that each one is filtered to meet our specific needs. It is commonly called as a sniffer, network protocol analyzer, and network analyzer.

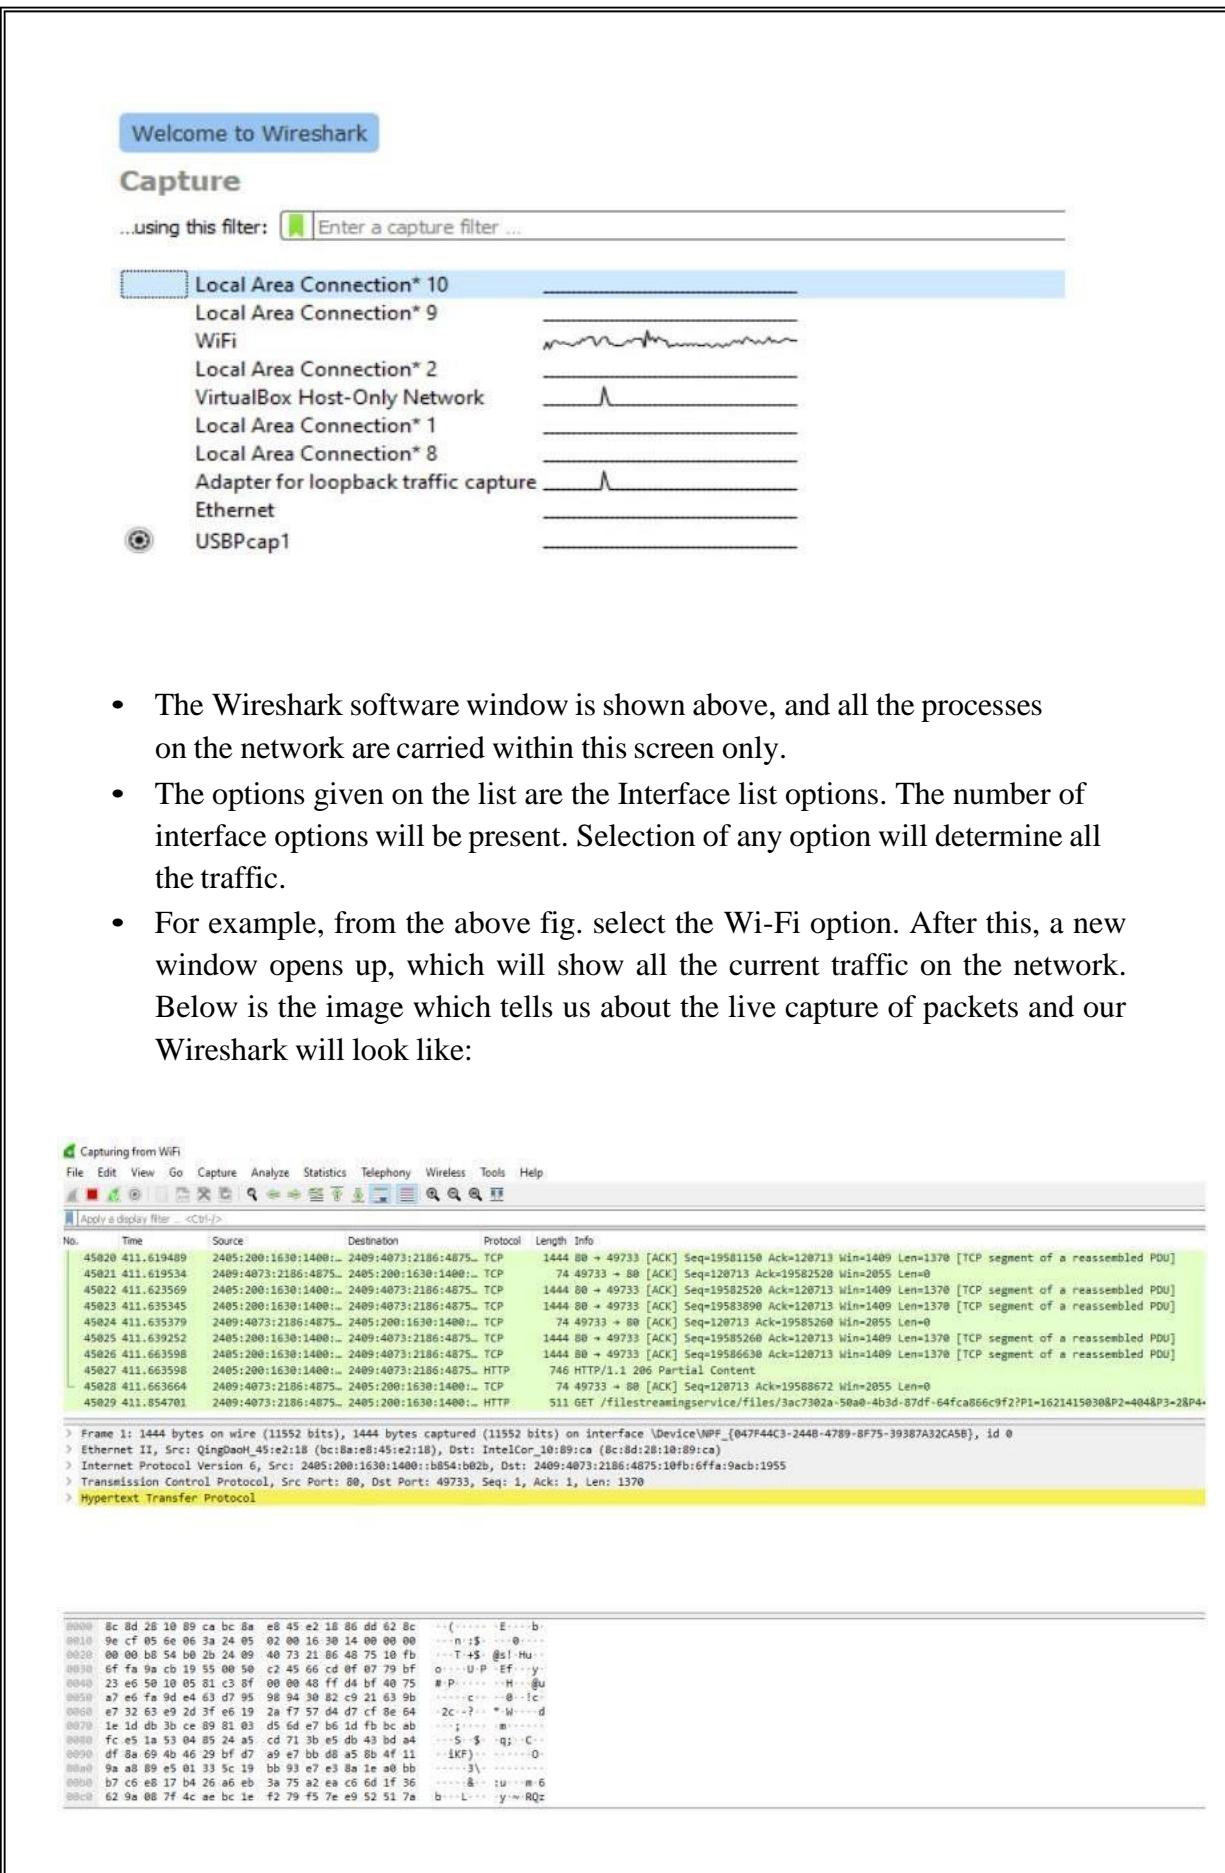

It is also used by network security engineers to examine security problems.

Wireshark is a data capturing program that "understands" the structure (encapsulation) of different networking protocols. It can parse and display the fields, along with their meanings as specified by different networking protocols. Wireshark uses pcap to capture packets, so it can only capture packets on the types of networks that pcap supports.

### **Installation of Wireshark Software**

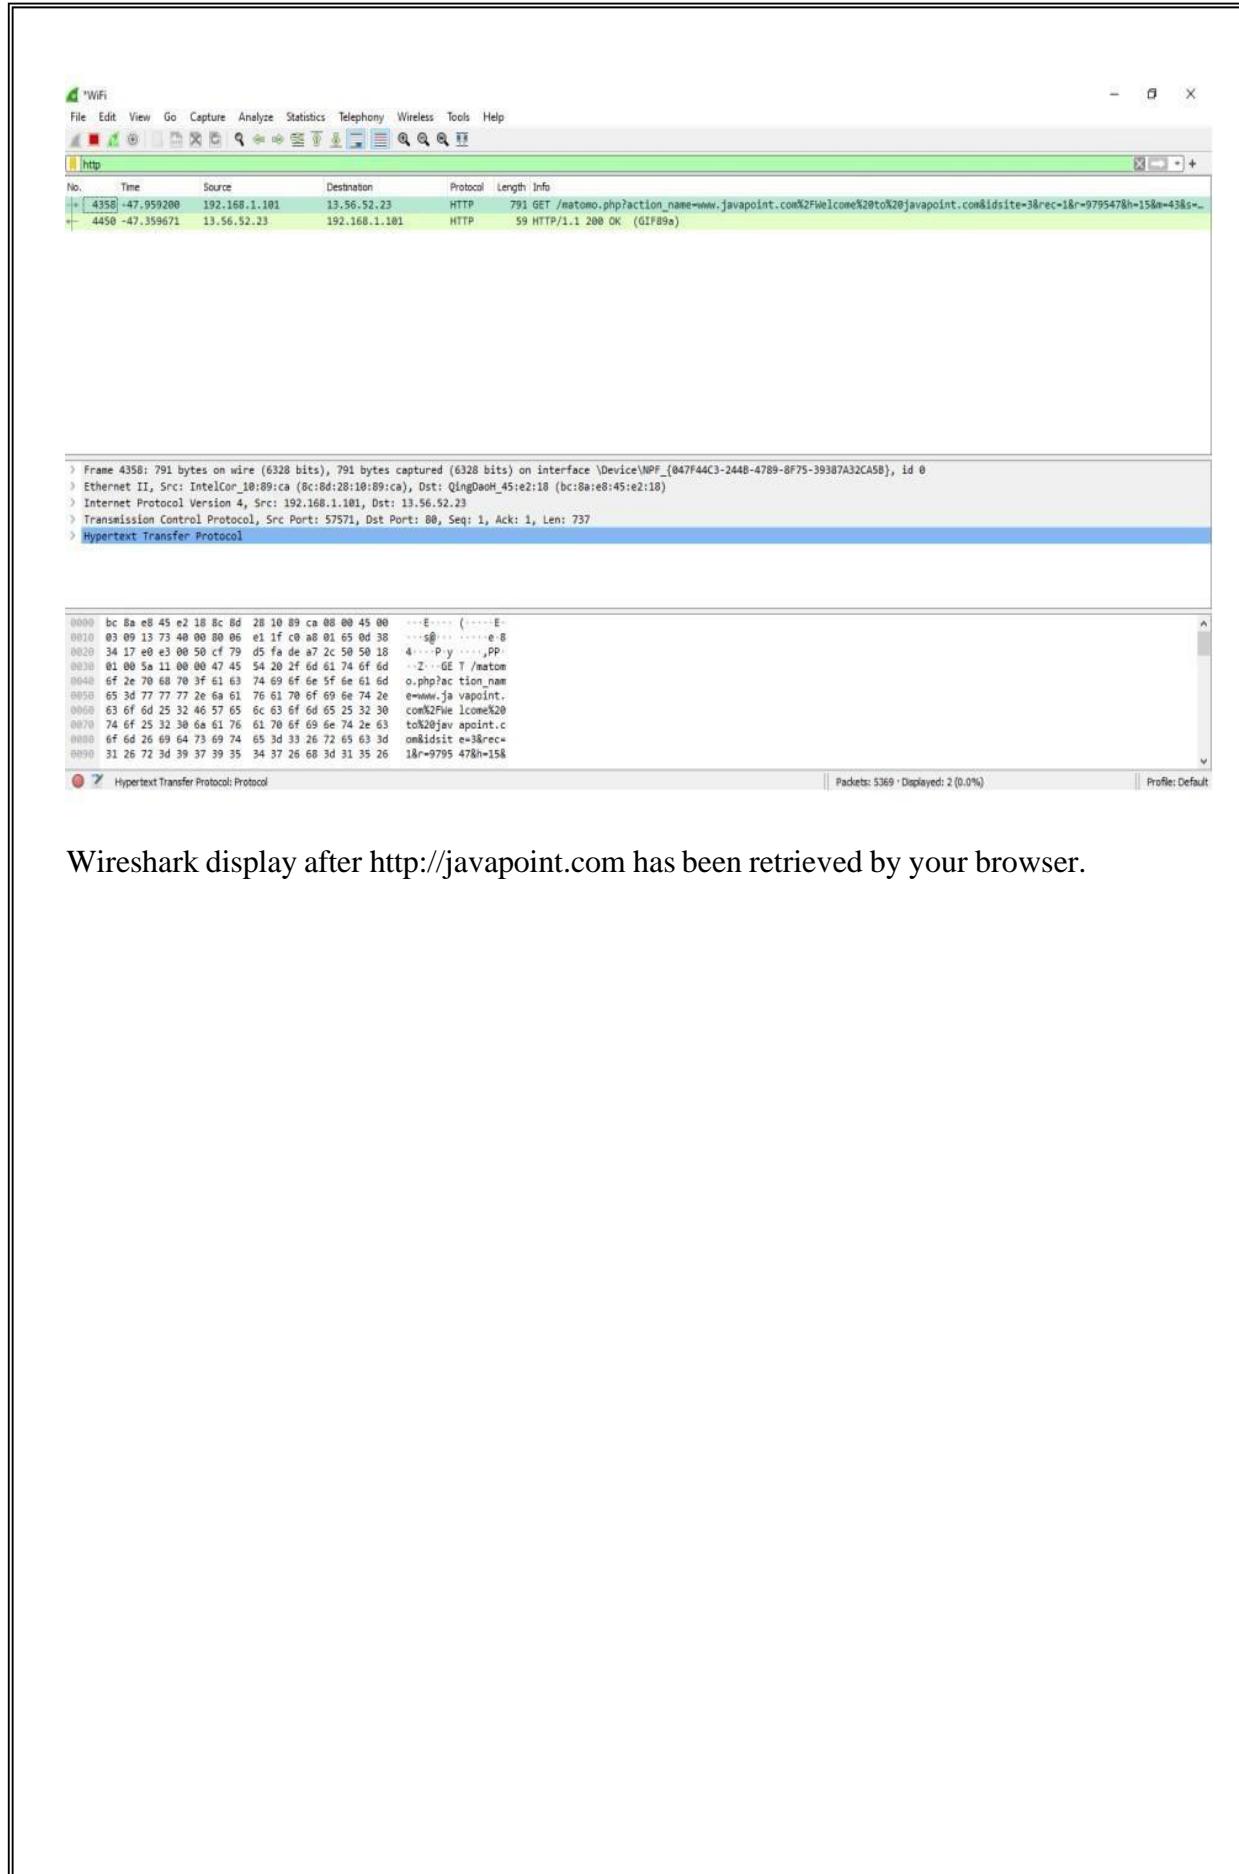

Below are the steps to install the Wireshark software on the computer:

- Open the web browser.
- Search for 'Download Wireshark'.
- Select the Windows installer according to your system configuration, either 32-bit or 64-bit. Save the program and close the browser.
- Now, open the software, and follow the install instruction by accepting the license. The Wireshark is ready for use.
- On the network and Internet settings option, we can check the interface connected to our computer.
- By selecting the current interface, we can get the traffic traversing through that interface. The version used here is 3.0.3. This version will open as:

## How to retrieve web pages using http and wireshark to capture the packets?

- Start up your web browser.
- Start up the Wireshark packet sniffer. Enter “http” in the display-filterspecification window, so that only captured HTTP messages will be displayed later in the packet-listing window. (We’re only interested in the HTTP protocol here, and don’t want to see the clutter of all captured packets).
- Wait a bit more than one minute ( we’ll see why shortly), and then begin wireshark packet capture.
- Enter the following URL in your web browser: <http://www.javapoint.com>
- Now stop the Wireshark packet capture.
- Find the lines in Wireshark that correspond to your browser retrieving the above URL. That is, the “GET message” (from your browser to the web server) and the response message from the server to your browser. The packet-contents window shows details of the selected message (in this case the HTTP OK message, which is highlighted in the packet-listing window). Recall that since the HTTP message was carried inside a TCP segment, which was carried inside an IP datagram, which was carried within an Ethernet frame, Wireshark displays the Frame, Ethernet, IP, and TCP packet information as well.
- Make sure the boxes at the far left of the Frame, Ethernet, IP and TCP information have a plus sign or a right-pointing triangle (which means there is hidden, undisplayed information), and the HTTP line has a minus sign or a down-pointing triangle (which means that all information about the HTTP message is displayed).

Wireshark display after <http://javapoint.com> has been retrieved by your browser.

## **EXPERIMENT No – 9**

### **Laravel installation On Ubuntu with Apache**

#### **Step 1 – Install Apache Web Server**

Let's open up a Terminal and do first thing first update your package list using Sudo apt update command.

**\$ sudo apt update**

After updating your package list install apache webserver

**\$ sudo apt install apache2**

**\$ systemctl status apache2**

```
ebin@ebin-VirtualBox:~$ sudo apt install apache2
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following packages were automatically installed and are no longer required:
  linux-headers-5.11.0-25-generic linux-hwe-5.11-headers-5.11.0-25 linux-image-5.11.0-25-generic linux-modules-5.11.0-25-generic
Use 'sudo apt autoremove' to remove them.
The following additional packages will be installed:
  apache2-bin apache2-data apache2-utils
Suggested packages:
  apache2-doc apache2-suexec-pristine | apache2-suexec-custom
The following packages will be upgraded:
  apache2 apache2-bin apache2-data apache2-utils
4 to upgrade, 0 to newly install, 0 to remove and 78 not to upgrade.
Need to get 1,518 kB of archives.
After this operation, 4,096 B of additional disk space will be used.
Do you want to continue? [Y/n] y
Get:1 http://in.archive.ubuntu.com/ubuntu focal-updates/main amd64 apache2 amd64 2.4.41-4ubuntu3.5 [95.5 kB]
Get:2 http://in.archive.ubuntu.com/ubuntu focal-updates/main amd64 apache2-bin amd64 2.4.41-4ubuntu3.5 [1,180 kB]
Get:3 http://in.archive.ubuntu.com/ubuntu focal-updates/main amd64 apache2-data all 2.4.41-4ubuntu3.5 [159 kB]

Fetched 1,518 kB in 1s (1,216 kB/s)
```

Now, check the status of apache server whether it is running or not.

If the Apache server not running then use the following command to start apache serve and add to boot startup.

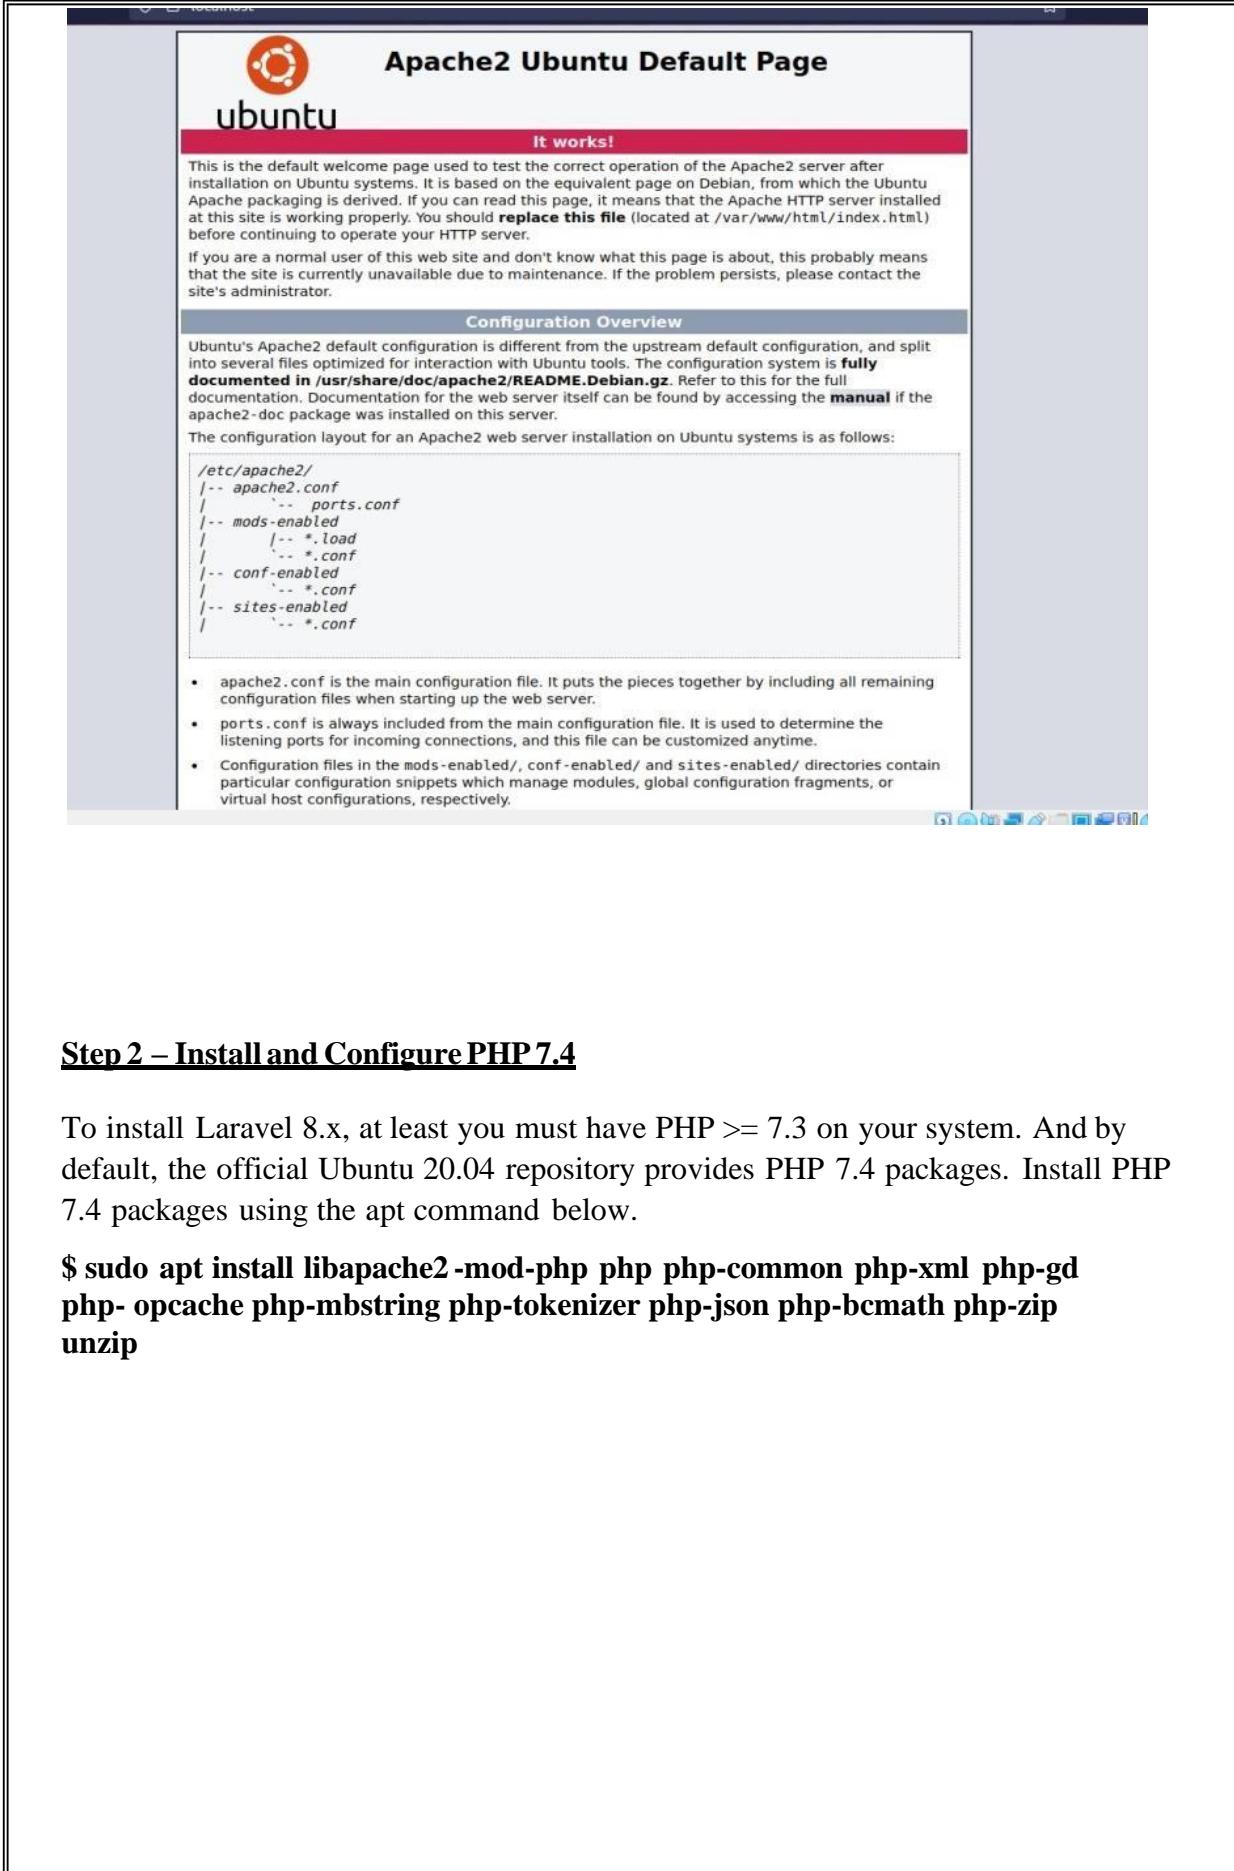

**\$ systemctl start apache2**

**\$ systemctl enable apache2**

```
ebin@ebin-VirtualBox:~$ systemctl status apache2

lines 1-19/19 (END)
```

Open browser, goto localhost and check if default apache server page is available or not

## **Step 2 – Install and Configure PHP 7.4**

To install Laravel 8.x, at least you must have PHP  $\geq$  7.3 on your system. And by default, the official Ubuntu 20.04 repository provides PHP 7.4 packages. Install PHP 7.4 packages using the apt command below.

```
$ sudo apt install libapache2-mod-php php php-common php-xml php-gd  
php-opcache php-mbstring php-tokenizer php-json php-bcmath php-zip  
unzip
```

```
ebin@ebin-VirtualBox:~$ sudo apt install libapache2-mod-php php php-common php-xml php-gd php-opcache php-mbstring php-tokenizer php-js
on php-bcmath php-zip unzip
[sudo] password for ebin:
Reading package lists... Done
Building dependency tree
Reading state information... Done
Package php-opcache is a virtual package provided by:
  php8.1-opcache 8.1.0~rc2-1+ubuntu20.04.1+deb.sury.org+1
  php8.0-opcache 8.0.11-1+ubuntu20.04.1+deb.sury.org+1
  php7.4-opcache 7.4.24-1+ubuntu20.04.1+deb.sury.org+1
  php7.3-opcache 7.3.31-1+ubuntu20.04.1+deb.sury.org+1
  php7.2-opcache 7.2.34-2+ubuntu20.04.1+deb.sury.org+1
  php7.1-opcache 7.1.33-41+ubuntu20.04.1+deb.sury.org+1
  php7.0-opcache 7.0.33-54+ubuntu20.04.1+deb.sury.org+1
  php5.6-opcache 5.6.40-54+ubuntu20.04.1+deb.sury.org+1
You should explicitly select one to install.
```

```
ebin@ebin-VirtualBox:~$ php7.4-dev php7.4-zip php7.4-mbstring php7.4-mysql php7.4-xml curl -y
php7.4-dev: command not found
ebin@ebin-VirtualBox:~$ sudo apt install php7.4 libapache2-mod-php7.4 php7.4-curl php-pear php7.4-gd php7.4-dev php7.4-zip php7.4-mbstring php7.4-mysql php7.4-xml curl -y
Reading package lists... Done
Building dependency tree
Reading state information... Done
The following packages were automatically installed and are no longer required:
  linux-headers-5.11.0-25-generic linux-hwe-5.11-headers-5.11.0-25 linux-image-5.11.0-25-generic linux-modules-5.11.0-25-generic
  linux-modules-extra-5.11.0-25-generic
Use 'sudo apt autoremove' to remove them.
The following additional packages will be installed:
  autoconf automake autopoint autotools-dev debhelper dh-autoreconf dh-strip-nondeterminism dwz gettext intltool-debian
  libarchive-cpio-perl libarchive-zip-perl libcroco3 libdebbhelper-perl libfile-stripnondeterminism-perl libltdl-dev

Get:8 http://in.archive.ubuntu.com/ubuntu focal-updates/main amd64 curl amd64 7.68.0-1ubuntu2.7 [161 kB]
```

Now go ahead and make tweak changes in PHP ini file and set cgi.fix\_pathinfo set to be 0. If this number is kept as a 1, the php interpreter will do its best to process the file that is as near to the requested file as possible. This is a possible security risk. If this number is set to 0, conversely, the interpreter will only process the exact file path—a much safer alternative.

```
$ cd /etc/php/7.4/apache2
$ sudo nano php.ini
```

Press **ctrl+w** and search for the word “cgi.fix” the uncomment the line and set it to 0.

```
...
cgi.fix_pathinfo=0
...
```

```
ebin@ebin-VirtualBox:~$ cd /etc/php
ebin@ebin-VirtualBox:/etc/php$ ls
7.4 8.0
ebin@ebin-VirtualBox:/etc/php$ cd 7.4/
ebin@ebin-VirtualBox:/etc/php/7.4$ ls
apache2 cli mods-available
ebin@ebin-VirtualBox:/etc/php/7.4$ cd apache2/
ebin@ebin-VirtualBox:/etc/php/7.4/apache2$ ls
conf.d php.ini
ebin@ebin-VirtualBox:/etc/php/7.4/apache2$ sudo nano php.ini
ebin@ebin-VirtualBox:/etc/php/7.4/apache2$ sudo nano php.ini
ebin@ebin-VirtualBox:/etc/php/7.4/apache2$ █
```

```
GNU nano 4.8                               php.ini

```

Press Ctrl + x then y to Save and Exit.

Now Restart The apache service.

**\$ systemctl restart apache2**

### **Step 3 – Install Composer PHP Packages Management**

Install the composer package manager go ahead and download and install Composer. and move the composer .phar file to /usr/local/bin/composer directory.

**\$ sudo apt install curl  
\$ curl -sS https://getcomposer.org/installer | php  
\$ sudo mv composer.phar /usr/local/bin/composer**

```
ebin@ebin-VirtualBox:~$ sudo apt install curl
Reading package lists... Done
Building dependency tree
Reading state information... Done
curl is already the newest version (7.68.0-1ubuntu2.7).
The following packages were automatically installed and are no longer required:
  linux-headers-5.11.0-25-generic linux-hwe-5.11-headers-5.11.0-25 linux-image-5.11.0-25-generic linux-modules-5.11.0-25-ge
  linux-modules-extra-5.11.0-25-generic
Use 'sudo apt autoremove' to remove them.
0 to upgrade, 0 to newly install, 0 to remove and 76 not to upgrade.
ebin@ebin-VirtualBox:~$ curl -sS https://getcomposer.org/installer | php
All settings correct for using Composer
Downloading...

Composer (version 2.1.8) successfully installed to: /home/ebin/composer.phar
Use it: php composer.phar

ebin@ebin-VirtualBox:~$ sudo mv composer.phar /usr/local/bin/composer
ebin@ebin-VirtualBox:~$
```

```
ebin@ebin-VirtualBox:~$ composer --version
Composer version 2.1.8 2021-09-15 13:55:14
ebin@ebin-VirtualBox:~$
```

#### **Step 4 – Install Laravel 8.x on Ubuntu 20.04**

Now install Laravel Framework using composer, just type composer global require Laravel/installer It will take a while to complete download its dependencies.

```
ebin@ebin-VirtualBox:~$ composer global require laravel/installer
Changed current directory to /home/ebin/.config/composer
Using version ^4.2 for laravel/installer
./composer.json has been created

```

As you had seen above image, all packages have been installed on the ‘`~/.config/composer`’ directory. Next, we need to add the ‘`bin`’ directory to the PATH environment through the `~/.bashrc` configuration. So Now Edit the `~/.bashrc` configuration using nano command.

**\$ nano `~/.bashrc`**

And add the following line at the end of the file.

```
...
export PATH="$HOME/.config/composer/vendor/bin:$PATH"
...
```

```

GNU nano 4.8                               /home/ebin/.bashrc
# Add an "alert" alias for long running commands.  Use like so:
#   sleep 10; alert
alias alert='notify-send --urgency=low -i "$( [ $? = 0 ] && echo terminal ||

# Alias definitions.
# You may want to put all your additions into a separate file like
# ~/.bash_aliases, instead of adding them here directly.
# See /usr/share/doc/bash-doc/examples in the bash-doc package.

if [ -f ~/.bash_aliases ]; then
    . ~/.bash_aliases
fi

# enable programmable completion features (you don't need to enable
# this, if it's already enabled in /etc/bash.bashrc and /etc/profile
# sources /etc/bash.bashrc).
if ! shopt -oq posix; then
    if [ -f /usr/share/bash-completion/bash_completion ]; then
        . /usr/share/bash-completion/bash_completion
    elif [ -f /etc/bash_completion ]; then
        . /etc/bash_completion
    fi
fi
export PATH="$HOME/.config/composer/vendor/bin:$PATH"
[

^C Get Help      ^O Write Out     ^W Where Is      ^K Cut Text      ^J Justify
^X Exit         ^R Read File     ^\ Replace       ^U Paste Text    ^T To Spell

```

Press Ctrl + x then y to Save and Exit.

Now reload your bashrc configuration using the source command.

**\$ source ~/.bashrc**

Now echo \$PATH. It will return your “Bin” directory path for the Composer package.

**\$ echo \$PATH**

```

ebin@ebin-VirtualBox:~$ nano ~/.bashrc
ebin@ebin-VirtualBox:~$ nano ~/.bashrc
ebin@ebin-VirtualBox:~$ source ~/.bashrc
ebin@ebin-VirtualBox:~$ echo $PATH
/home/ebin/.config/composer/vendor/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/local/games:/snap/bin
ebin@ebin-VirtualBox:~$ 

```

The ‘bin’ directory for the composer packages has been added to the \$PATH environment variable. And as a result, you can use the command ‘laravel’ to start and create a new project. Now go ahead and type Laravel new then your project name to start a new Laravel project.

**\$ laravel new myapp1**

This will take a while to download all dependencies required by Laravel.

```
ebin@ebin-VirtualBox:~$ laravel new myapp1
[laravel logo]
Creating a "laravel/laravel" project at "./myapp1"
Installing laravel/laravel (v8.6.2)
- Downloading laravel/laravel (v8.6.2)
- Installing laravel/laravel (v8.6.2): Extracting archive
Created project in /home/ebin/myapp1
> @php -r "file_exists('.env') || copy('.env.example', '.env');"
Loading composer repositories with package information
Updating dependencies
Lock file operations: 110 installs, 0 updates, 0 removals
- Locking asm89/stack-cors (v2.0.3)
- Locking brick/math (0.9.3)
- Locking dflydev/dot-access-data (v3.0.1)

- Locking facade/ignition-contracts (1.0.2)
- Locking fakerphp/faker (v1.16.0)
```

Here you can see the installation of my new project myapp1 finished. You can also see inside my home directory a new directory has been created with my project name.

### **Step 5 – Finally Configure Apache for Laravel and test it**

First, add your project directory to www-data group use the following command

**\$ sudo chgrp -R www-data /home/ebin/myapp1**

-R flag is recursive, Recursive means all subdirectory and files under your project directory become changed to the “www-data” group.

Also, you need to change access permission 775 of the storage directory under your project. So, go ahead and use the following command.

**\$ sudo chmod -R 775 /home/ebin/myapp1/storage**

```

bash: cd: home: No such file or directory
ebin@ebin-VirtualBox:~$ pwd
/home/ebin
ebin@ebin-VirtualBox:~$ /home/ebin/myapp1
bash: /home/ebin/myapp1: Is a directory
ebin@ebin-VirtualBox:~$ cd /home/ebin/myapp1
ebin@ebin-VirtualBox:~/myapp1$ cd ..
ebin@ebin-VirtualBox:~$ sudo chgrp -R www-data /home/ebin/myapp1
[sudo] password for ebin:
ebin@ebin-VirtualBox:~$ sudo chmod -R 775 /home/ebin/myapp1/storage
ebin@ebin-VirtualBox:~$ █

```

Now create an apache vhost configuration go to the following directory and create a vhost config file using nano file editor.

```

$ cd /etc/apache2/sites-available/
$ sudo nano myapp1.com.conf

```

And paste the following line inside the file.

```

<VirtualHost *:80>
    ServerName myapp1.com
    ServerAdmin admin@myapp1.com
    DocumentRoot /home/ebin/myapp1/public

    <Directory /home/ebin/myapp1>
        Options Indexes MultiViews
        AllowOverride None
        Require all granted
    </Directory>

    ErrorLog ${APACHE_LOG_DIR}/error.log
    CustomLog ${APACHE_LOG_DIR}/access.log combined
</VirtualHost>

```

//All Red colored text must be changed as per your//

```

ebin@ebin-VirtualBox:~$ cd /etc/apache2/sites-available/
ebin@ebin-VirtualBox:/etc/apache2/sites-available$ sudo nano myapp1.com.conf
ebin@ebin-VirtualBox:/etc/apache2/sites-available$ █

```

```

GNU nano 4.8
<VirtualHost *:80>
  ServerName myapp1.com

  ServerAdmin admin@myapp1.com
  DocumentRoot /home/ebin/myapp1/public

  <Directory /home/ebin/myapp1>
    Options Indexes MultiViews
    AllowOverride None
    Require all granted
  </Directory>

  ErrorLog ${APACHE_LOG_DIR}/error.log
  CustomLog ${APACHE_LOG_DIR}/access.log combined
</VirtualHost>

[ Read 16 lines ]
^G Get Help      ^O Write Out     ^W Where Is      ^K Cut Text      ^J Justify
^X Exit          ^R Read File     ^A Replace       ^U Paste Text    ^T To Spell

```

Now enable mod rewrite for apache2 just type

**\$ sudo a2enmod rewrite**

Now enable your site, just type

**\$ sudo a2ensite myapp1.com.conf**

Finally, Restart the apache service, type

**\$ systemctl restart apache2**

```

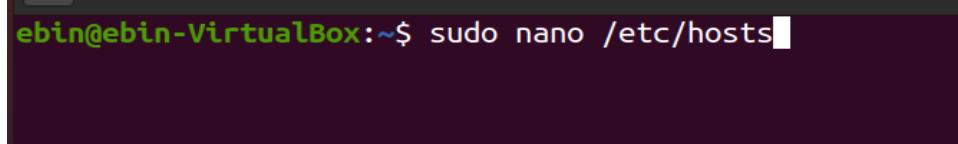

ebin@ebin-VirtualBox:~$ cd /etc/apache2/sites-available/
ebin@ebin-VirtualBox:/etc/apache2/sites-available$ sudo nano myapp1.com.conf
ebin@ebin-VirtualBox:/etc/apache2/sites-available$ sudo nano myapp1.com.conf
ebin@ebin-VirtualBox:/etc/apache2/sites-available$ sudo a2enmod rewrite
Enabling module rewrite.
To activate the new configuration, you need to run:
  systemctl restart apache2
ebin@ebin-VirtualBox:/etc/apache2/sites-available$ sudo a2ensite myapp1.com.conf
Enabling site myapp1.com.
To activate the new configuration, you need to run:
  systemctl reload apache2
ebin@ebin-VirtualBox:/etc/apache2/sites-available$ systemctl restart apache2
ebin@ebin-VirtualBox:/etc/apache2/sites-available$
```

As you are in a local environment you need a local dns resolver for your site. Go ahead and edit /etc/hosts file, add a dns record for your site then save the file.

```
$ sudo nano /etc/hosts
```

...

```
127.0.0.1 myapp1.com
```

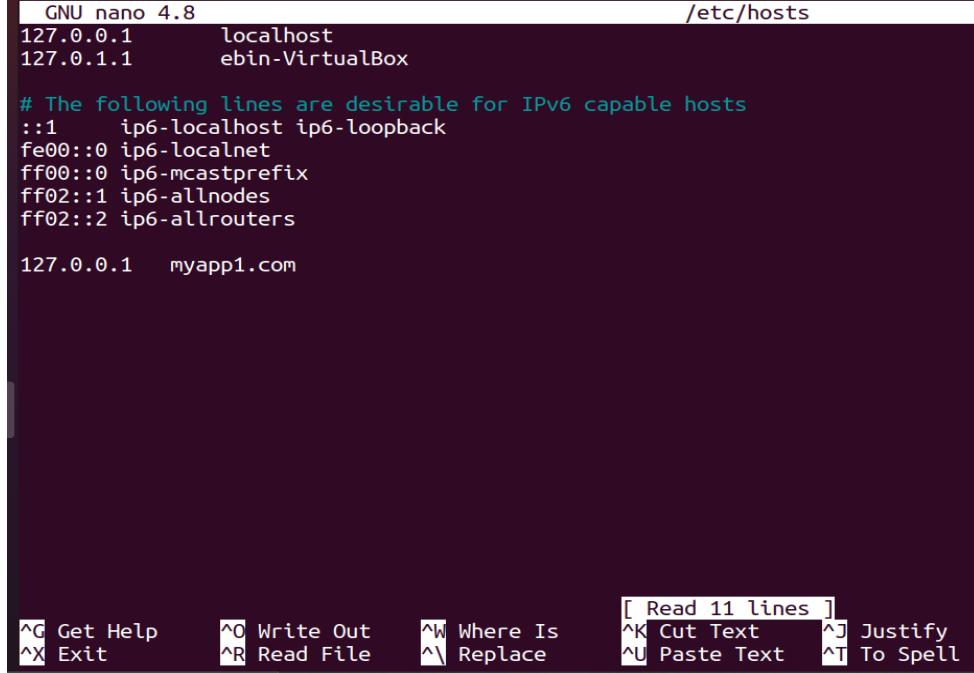

```
ebin@ebin-VirtualBox:~$ sudo nano /etc/hosts
```

```
GNU nano 4.8                               /etc/hosts
127.0.0.1      localhost
127.0.1.1      ebin-VirtualBox
```

```
# The following lines are desirable for IPv6 capable hosts
::1      ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
```

```
127.0.0.1    myapp1.com
```

```

```

Now get back to the web browser and open a tab then type your project hostname.

And here it is it's working. Here you can see the Laravel version and PHP version.
